The title compound, $C_{17}H_{21}NO_4$, consists of substituted Meldrum's acid with a [4-(diethylamino)phenyl]methylidene fragment attached to the fifth position. The heterocycle assumes a distorted boat conformation. The planar part of heterocycle is almost coplanar with the benzene ring due to the presence of a long conjugated system in the molecule. This leads to the formation of C—H···O-type intramolecular contacts. As a result of the absence of hydrogen-bond donors in the structure, the crystal packing is controlled by van der Waals forces and weak C—H···O interactions, which associate the molecules into inversion dimers.

1. Chemical context

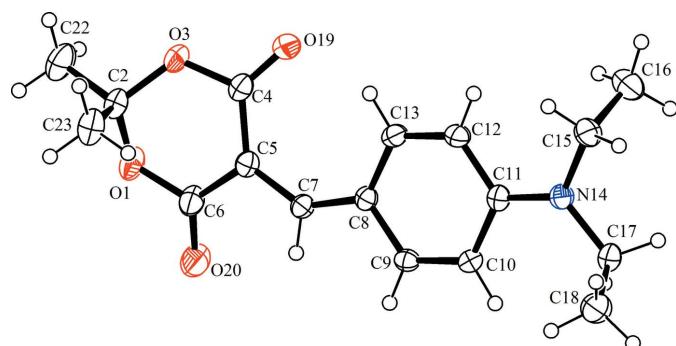

Arylidene Meldrum's acids (5-arylmethylene-2,2-dimethyl-1,3-dioxane-4,6-diones) are attractive building blocks in organic chemistry: these compounds are used for the synthesis of different heterocycles. Recent examples include: pyrazolidinones (Pair *et al.*, 2014), lactames (Zhang *et al.*, 2013), carbocycles (*e.g.* Trost & Maruniak, 2013) and aliphatic compounds (*e.g.* Mohite & Bhat, 2013). Arylidene Meldrum's acids can be easily converted to arylmethyl Meldrum's acids [for a description of a typical procedure, see Mierina *et al.* (2015)], which serve as starting compounds for the synthesis of various valuable compounds [for a mini-review, see Mierina (2014)]. Apart from their wide application in syntheses, these derivatives of Meldrum's acid have been studied as platelet aggregation inhibitors (El Maatougui *et al.*, 2012), antimalarial agents and anti-oxidants (Sandhu *et al.*, 2010) and photostable UV-filters for cosmetic applications (Habeck & Krause, 1999).

2. Structural commentary

The title compound, $C_{17}H_{21}NO_4$, consists of substituted Meldrum's acid with a [4-(diethylamino)phenyl]methylidene fragment attached to fifth position (Fig. 1.). The heterocycle assumes a distorted boat conformation. Atoms C2 and C5

OPEN ACCESS

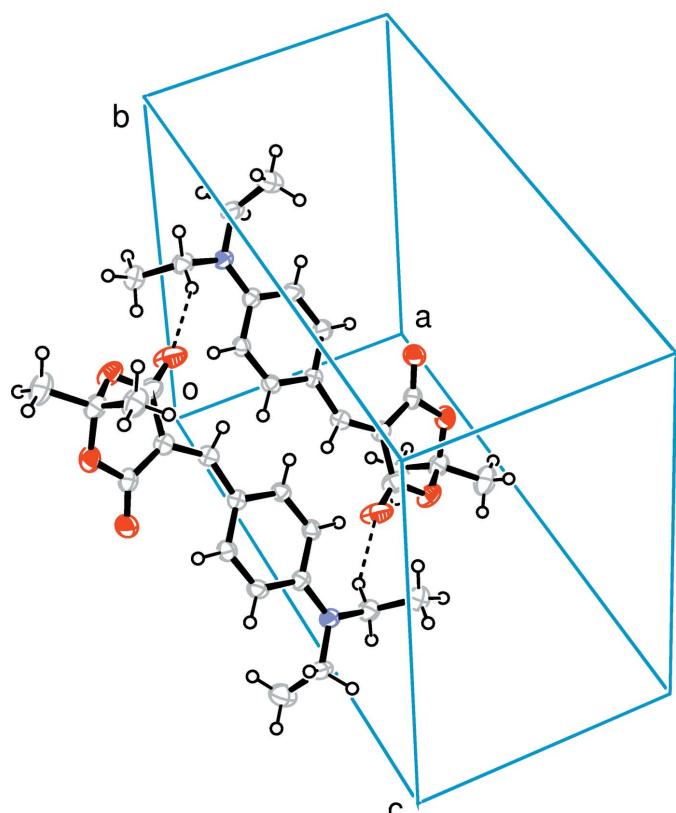

**Figure 1**

The molecular structure the title compound, showing 50% probability displacement ellipsoids and the atomic numbering

deviate from the least-squares plane [maximum deviations ± 0.013 (1) Å] calculated for the other four atoms of the heterocycle by 0.549 (3) and 0.154 (3) Å, respectively. The planar part of heterocycle is nearly coplanar with the benzene ring [dihedral angle = 8.05 (10)°] due to the presence of a long conjugated system in the molecule. This leads to the formation of C–H···O-type intramolecular contacts (Table 1).

π – π stacking interactions are also observed between conjugated systems of the molecules. The distance between the corresponding least-square planes is 3.54 (su?) Å.

The crystal structure of the zwitterionic form of 5-[4-(diethylamino)benzyl]-2,2-dimethyl-1,3-dioxane-4,6-dione has

Symmetry code: (i) $-x, -y + 1, -z + 1$.

been already reported (Mierina *et al.*, 2015). The title compound differs from this by the presence of a double bond between atoms C5 and C7.

3. Supramolecular features

Because of the absence of hydrogen-bond donors in the structure, the crystal packing is controlled by van der Waals forces and weak C–H···O interactions, which associate molecules into inversion dimers (Fig. 2, Table 1).

4. Database survey

Several 5-arylidene-2,2-dimethyl-1,3-dioxane-4,6-diones (Huck *et al.*, 1995; Gould *et al.*, 1998; Novoa de Armas *et al.*, 2000; O'Leary *et al.*, 2001; O'Leary & Wallis 2006; Crawford & McNab, 2009; Wilsily & Fillion, 2009; Zeng, 2010a,b, 2011a,b,c, 2013; Jie, 2012; García-Álvarez *et al.*, 2013; Dey *et al.*, 2015) and their spiro-analogues (Sato *et al.*, 1989; Zeng, 2011d,e,f; Zeng *et al.* 2013) have been characterized by X-ray analysis. However, information on the crystal structure of 5-arylmethylidene-2,2-dimethyl-1,3-dioxane-4,6-diones containing an amino functionality on the aromatic ring is not available.

5. Synthesis and crystallization

5-[4-(Diethylamino)phenylmethylidene]-2,2-dimethyl-1,3-dioxane-4,6-dione was obtained from Meldrum's acid (1.00 g, 6.9 mmol) and 4-diethylaminobenzaldehyde (1.27 g, 6.9 mmol) by heating in water (50 ml) at 348 K for 2 h, followed by cooling to room temperature and filtration of the formed precipitate and recrystallization from ethanol (1.62 g, 80%) analogously to the method described previously (Mierina *et al.*, 2015). The spectroscopic and physical data correspond to those in the literature (Mierina *et al.*, 2015). X-ray quality single crystals were obtained by slow evaporation from ethanol.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The C-bound H atoms were positioned geometrically and refined as riding on their parent atoms: C–H = 0.93–0.98 Å with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and $1.2U_{\text{eq}}(\text{C})$ for other H atoms.

Data collection

Nonius KappaCCD	2183 reflections with $I > 2\sigma(I)$
diffractometer	$R_{\text{int}} = 0.054$
Radiation source: fine-focus sealed tube	$\theta_{\text{max}} = 27.5^\circ, \theta_{\text{min}} = 2.3^\circ$
Graphite monochromator	$h = -10 \rightarrow 10$
CCD scans	$k = -14 \rightarrow 13$
6627 measured reflections	$l = -23 \rightarrow 23$
3705 independent reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.055$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.127$	H-atom parameters constrained
$S = 1.00$	
3705 reflections	
203 parameters	
0 restraints	

$$w = 1/[\sigma^2(F_o^2) + (0.0534P)^2 + 0.0774P]$$

where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$

$$\Delta\rho_{\max} = 0.18 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.19 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
