Edited by D.-J. Xu, Zhejiang University (Yuquan Campus), China

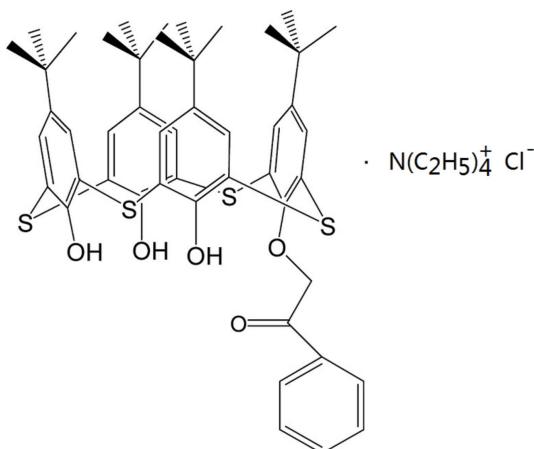

The asymmetric unit of the title compound,  $C_{48}H_{54}O_5S_4\cdot N(C_2H_5)_4^+\cdot Cl^-$ , contains two tetra-*tert*-butyl-[(benzoyl)methoxy]-trihydroxy-tetrathiocalix[4]arene molecules, two tetraethylammonium cations and two chloride anions. The two calixarene molecules in the asymmetric unit each display a cone conformation. There are no significant differences between the two independent molecules. The guest species do not sit within the calixarene ‘buckets’. In the crystal, extensive O–H···O, O–H···S and O–H···Cl hydrogen bonds and weak C–H···O, C–H···S and C–H···Cl interactions link the thiocalixarene molecules, tetraethylammonium cations and chloride anions, forming a three-dimensional network encompassing channels running parallel to the *a*-axis direction. The structure contains a solvent-accessible void of 76 (3) Å<sup>3</sup>, but no solvent molecule could reasonably be located. The crystal studied was an inversion twin with a 0.57 (8):0.43 (8) domain ratio.

**Keywords:** crystal structure; co-crystal; *p*-tert-butylthiocalix[4]arene; phase transfer catalysis; tetraethylammonium chloride; alkylation; hydrogen bonding.

## Crystal structure of the inclusion complex 25-benzoylmethoxy-5,11,17,23-tetra-*tert*-butyl-26,27,28-trihydroxy-2,8,14,20-tetrathiocalix[4]arene–tetraethylammonium chloride (1/1)

### S1. Comment

Calixarenes have been found to be an outstanding platform for creating attractive host molecules and have prominent host–guest recognition ability towards different ions. These macrocyclic have been used for catalysis, molecular recognition or ion separation and sensors (Gutsche, 1998; Shokova & Kovalev, 2003; Stoikov *et al.*, 2003). Since the discovery of *p*-*tert*-butylthiocalixarene in 1997 as a calixarene analogy with some additional features because of sulfur bridging atom in its skeleton structure, it attracts much attention in research rather than the classical calixarenes and exhibits a wide range of applications in supramolecular chemistry (Iki & Miyano, 2001; Morohashi *et al.*, 2002; Desroches *et al.*, 2003; Odo *et al.*, 2000; Odo *et al.*, 2001; Ben Ali *et al.*, 2001; Agrawal & Pancholi, 2007; Higuchi *et al.*, 2000; Omran & Antipin, 2014). Many calixarene derivatives are being used in both environmental and biomedical monitoring (McMahon *et al.*, 2003). Based on these findings we report here the synthesis and crystal structure of the title compound.

Two crystallographically independent molecules (A and B) in the asymmetric unit are shown in Figs 1 and 2, respectively, and together with two tetraethylammonium chloride molecules in Fig. 3. The bond lengths and bond angles of molecules A and B are within the normal ranges.

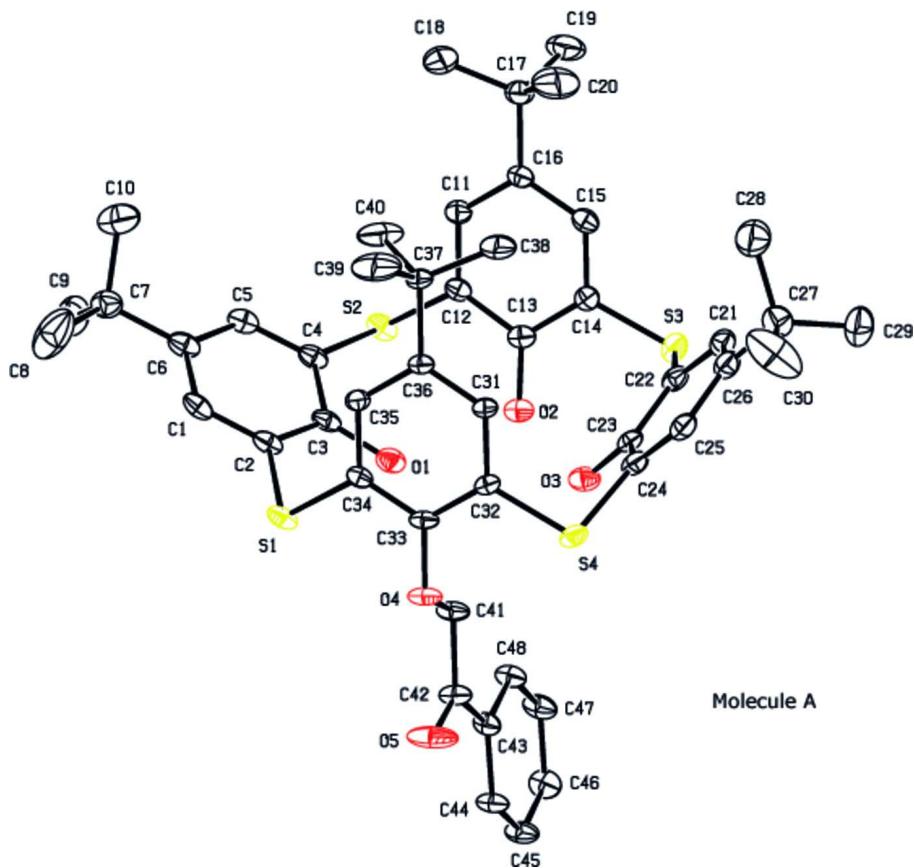

In the crystal structure, molecules are linked by C—H···O, C—H···S, C—H···Cl, O—H···O, O—H···S and O—H···Cl interactions, forming a three-dimensional network (Table 1). These lead to the formation of channels running parallel to the *a*-axis direction (Fig. 4).

### S2. Experimental

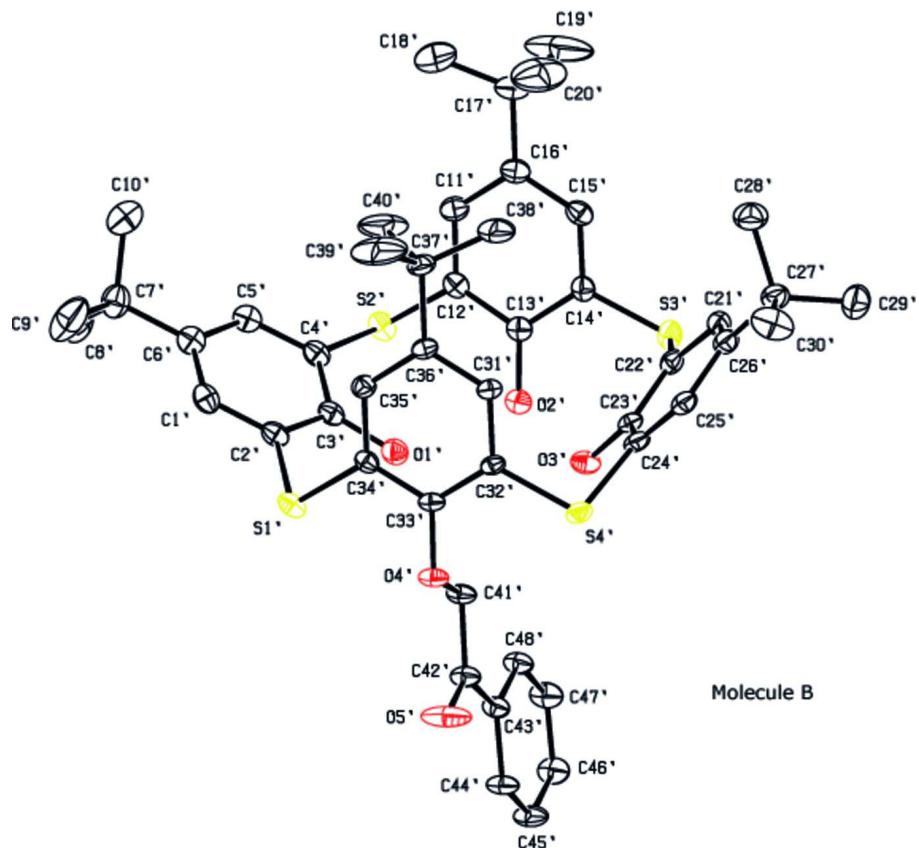

A mixture of *p*-*tert*-butylthiocalix[4]arene 1 g (1.38 mmol), anhydrous K<sub>2</sub>CO<sub>3</sub> 5.0 g, TEAB 0.4 g and phenacyl bromide 0.28–0.55 g (1.38–2.76 mmol) in 50 ml benzene was heated at 373 K for 48 h. the mixture was filtered and the benzene layer was evaporated to dryness. The solid residue was washed by diluted hydrochloric acid solution, extracted with methylene chloride. The methylene chloride layer was dried over magnesium sulfate then filtered and concentrated. The residue was treated with methyl alcohol to deposit a white solid product. The product was filtered off, dried under vacuum and recrystallized from a mixture of methylene chloride/methanol (1*v*/1*v*) to give colourless crystals suitable for X-ray diffraction in 90% yield.

**S3. Refinement**

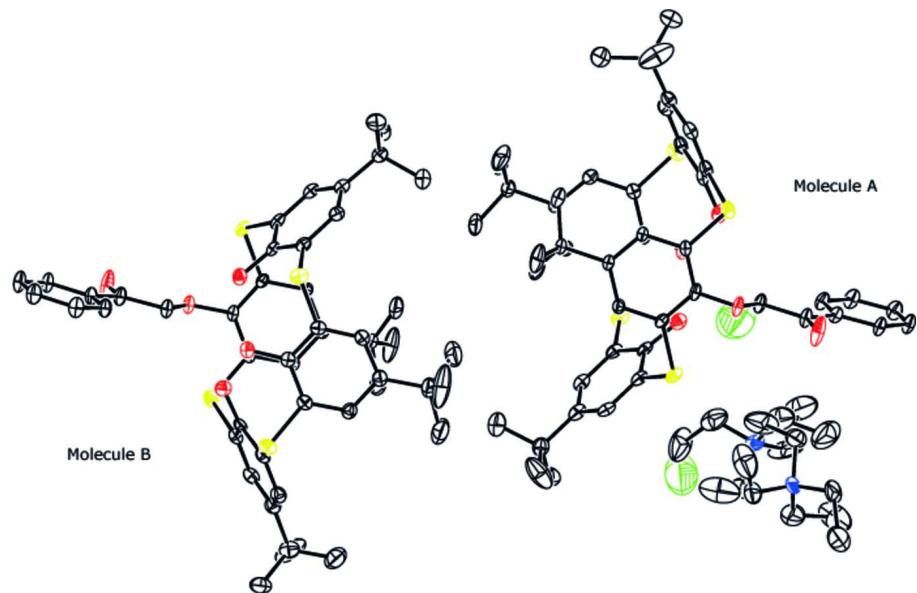

All H atoms were positioned geometrically and constrained to ride on their parent atoms (C—H = 0.93, 0.96 and 0.97 Å, O—H = 0.82 Å).  $U_{\text{iso}}(\text{H})$  values were set to a multiple of  $U_{\text{eq}}(\text{C}, \text{O})$  with 1.5 for CH<sub>3</sub> and OH, and 1.2 for CH and CH<sub>2</sub>. The (3 0 1), (4 0 8), (3 0 6), (-21 0 5), (1 4 0), (2 0 4), (-4 -9 22), (-4 -3 4), (1 0 8), (-12 5 3), (-2 0 10), (1 2 1), (-6 -3 6), (-4 3 4), (1 -4 0), (0 1 3), (3 0 0), (6 3 8) and (1 0 10) reflections were omitted owing to very bad agreement.

**Figure 1**

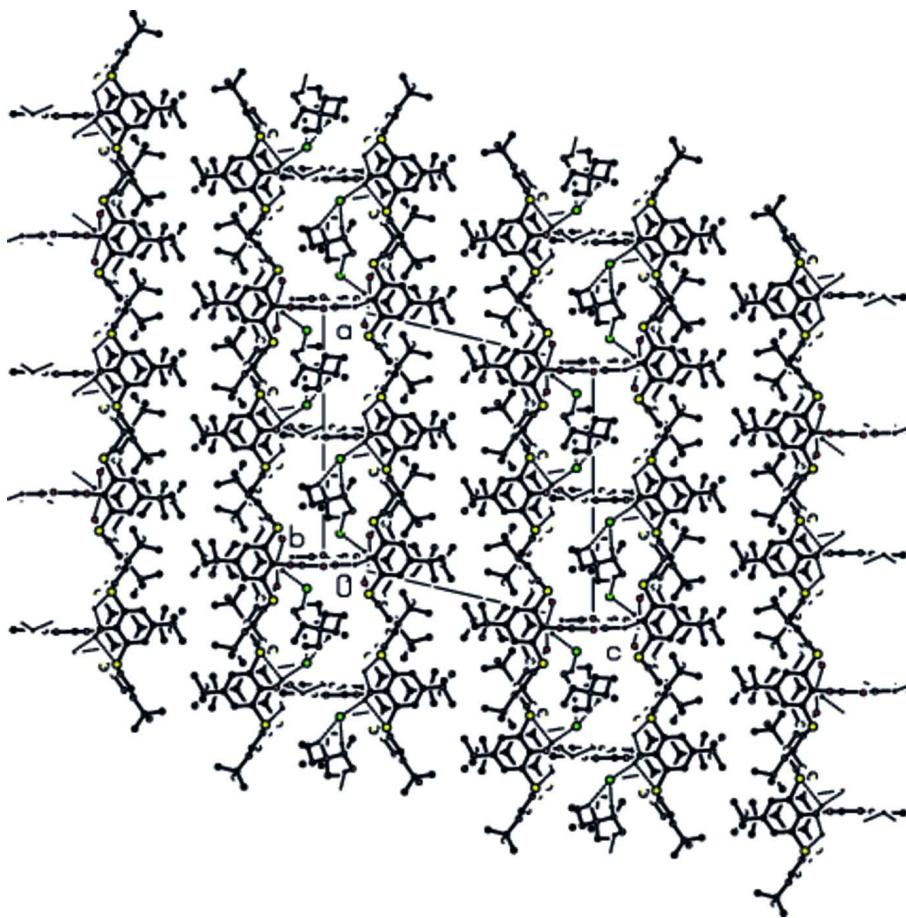

View of the molecule A of two molecules in the asymmetric unit with the atom-numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. All H atoms are omitted for clarity.

**Figure 2**

View of the molecule B of two molecules in the asymmetric unit with the atom-numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. All H atoms are omitted for clarity.

**Figure 3**

View of two molecules (A and B) with two solvent molecules in the asymmetric unit with the atom numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. All H atoms are omitted for clarity.

**Figure 4**

A view of the molecular packing down *b* axis. H atoms not involved in H bonding are omitted for clarity.

 $\Delta\rho_{\text{min}} = -0.88 \text{ e } \text{\AA}^{-3}$   
 Absolute structure: Flack (1983)  
 Absolute structure parameter: 0.43 (8)

#### Special details

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted R-factors wR and all goodnesses of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The observed criterion of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating -R-factor-obs etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
