Edited by H. Ishida, Okayama University, Japan

The title compound, $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{5}$, was crystallized from an aqueous solution of 6 -deoxy-L-psicose (6-deoxy-L-allulose, ( $3 S, 4 S, 5 S$ )-1,3,4,5-tetrahydroxyhexan-2-one), and the molecule was confirmed as $\alpha$-furanose with a ${ }^{3} T_{4}$ (or $E_{4}$ ) conformation, which is a predominant tautomer in solution. This five-membered furanose ring structure is the second example in the field of the 6-deoxy-ketohexose family. The cell volume of the title compound [742.67 (7) $\AA^{3}, Z=4$ at room temperature] is only $1.4 \%$ smaller than that of $\beta$-d-psicopyranose, $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}\left(753.056 \AA^{3}, Z=4\right.$ at room temperature $)$.

Keywords: crystal structure; hydrogen bonding; deoxy compound; rare sugar.

## Crystal structure of 6-deoxy- $\alpha$-L-psicofuranose

Akihide Yoshihara, Tomohiko Ishii, Tatsuya Kamakura, Hiroaki Taguchi and Kazuhiro Fukada

## S1. Comment

Psicose is classified into a rare sugar, and hardly exists in nature. In this study we prepare a single crystal of 6-deoxy-Lpsicose (Fig. 1), which is obtained by enzymatic isomerization of $L$-rhamnose, and investigate the structure by X-ray crystal analysis. The space group of this compound is orthorhombic $P 2_{1_{2}} 2_{1}$, which is the same as that of $\beta$ - $D$-psicopyranose (cf. D-psicose; Kwiecień et al., 2008; Fukada et al., 2010). The molecular weight of 6-deoxy-L-psicose $\left(\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{5}\right.$; $m . w .=164.16)$ is about $10 \%$ smaller than that of $D$-psicose (180.16). On the other hand, the cell volume of 6-deoxy- $\alpha-L-$ psicofuranose is 742.67 (7) $\AA^{3}$ at r.t., which is a mere $1.4 \%$ smaller than that of $\beta$ - $D$-psicopyranose ( $753.056 \AA^{3}$ at r.t., cf. $D$-psicose; Kwiecień et al., 2008; Fukada et al., 2010). This imbalance of decreasing suggests that a weaker intermolecular interaction caused by a smaller molecular density can be expected. The melting point of 6-deoxy- $\alpha-L-$ psicofuranose has been observed to be $76^{\circ} \mathrm{C}$, which is about $30^{\circ} \mathrm{C}$ lower than that of psicose $\left(107.6^{\circ} \mathrm{C}\right)$. This lower melting point is consistent with the suggested weaker intermolecular interaction.
We found that 6-deoxy- $L$-psicose molecules form a five-membered $\alpha$-furanose ring structure in crystal. In the crystals of ketohexoses so far, six-membered pyranose ring structures have been mainly confirmed (cf. D-psicose; Kwiecień et al., 2008; Fukada et al., 2010, 1-deoxy-L-sorbose; Jones et al., 2006). Because of the deoxygenation in the 6-deoxy-L-psicose molecule, the carbonyl group at the C-2 position cannot form hemiacetal with the C-6 but with the C-5 hydroxyl group. It should be noted that the crystal structure of 6-deoxy- $L$-sorbose, C-4 epimer of 6-deoxy- $L$-psicose, was reported to be $\alpha$ furanose; $\mathrm{C}^{\prime}$ '-exo-C4'-endo, ${ }_{3} \mathrm{~T}^{4}$ (Swaminathan et al., 1979). Therefore, the $\alpha$-furanose structure observed in the crystal of 6-deoxy-L-psicose is the second example in 6-deoxy-ketohexose family, with ${ }^{3} \mathrm{~T}_{4}$ (or $\mathrm{E}_{4}$ ) conformation. An intramolecular hydrogen bond ( $\mathrm{O} 3-\mathrm{H} 3 \mathrm{~A} \cdots \mathrm{O} 5$ ) has been observed both in a chiral D-psicose (Kwiecień et al., 2008; Fukada et al., 2010) and a racemic $D, L$-psicose (Ishii et al., 2015). This comes from two hydroxy groups located in a shorter distance from each other because of both axial conformations connecting to the C-3 and C-5 positions. On the other hand in the 6-deoxy- $L$-psicose, such an intramolecular hydrogen bond is not observed, because the hydroxy group at a C-5 position has been used for creating the ring structure. Intermolecular hydrogen bonds (O3-H3A․ㅇ2 and O1$\mathrm{H} 1 \mathrm{~A} \cdots \mathrm{O} 5)$ are also confirmed along the $b$-axis, and $\mathrm{O} 4-\mathrm{H} 4 \mathrm{~A} \cdots \mathrm{O} 4$ along the $a$-axis, as shown in Fig. 2.

## S2. Experimental

6-Deoxy- $L$-psicose was prepared from $L$-rhamnose by immobilized $L$-rhamnose isomerase and immobilized $D$-tagatose 3-epimerase in the batch reaction (Shompoosang et al., 2014). After this reaction was reached equilibrium, the reaction mixture containing 6-deoxy- $L$-psicose was separated by column chromatography. The purified 6-deoxy-L-psicose solution was concentrated to $80 \%$ by evaporation. A seed crystal of 6-deoxy-L-psicose was added to the $80 \% 6$-deoxy- $L$ psicose solution, which was kept at $30^{\circ} \mathrm{C}$. The tautomer ratio in aqueous solution at $30^{\circ} \mathrm{C}$ is obtained as $\alpha$-furanose : $\beta$ furanose : acyclic form $=72.9: 24.5: 2.69$ (Yoshihara et al., 2015). After one day, single crystals were obtained.

## S3. Refinement

H atoms bounded to methine-type $\mathrm{C}(\mathrm{H} 3 \mathrm{~B}, \mathrm{H} 4 \mathrm{~B}, \mathrm{H} 5 \mathrm{~A})$ were positioned geometrically and refined using a riding model with $\mathrm{C}-\mathrm{H}=0.98 \AA$ and $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C}) . \mathrm{H}$ atoms bounded to methylene-type $\mathrm{C}(\mathrm{H1B}, \mathrm{H1C})$ were positioned geometrically and refined using a riding model with $\mathrm{C}-\mathrm{H}=0.97 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C}) . \mathrm{H}$ atoms bounded to methyltype C (H6A, H6B, H6C) were positioned geometrically and refined using a riding model with $\mathrm{C}-\mathrm{H}=0.96 \AA$ and $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$. H atoms bounded to $\mathrm{O}(\mathrm{H} 1 \mathrm{~A}, \mathrm{H} 2 \mathrm{~A}, \mathrm{H} 3 \mathrm{~A}, \mathrm{H} 4 \mathrm{~A})$ were positioned geometrically and refined using a riding model with $\mathrm{O}-\mathrm{H}=0.82 \AA$ and $U_{\mathrm{is} 0}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{O})$, allowing for free rotation of the OH groups.

Figure 1
An ORTEP view of the title compound with the atom-labeling scheme. The thermal ellipsoids of all non-hydrogen atoms are drawn at the $50 \%$ probability level. H atoms are shown as small spheres of arbitrary radius.

Figure 2
A packing diagram of the title compound viewed down the $a$-axis, showing the hydrogen-bonding network (green dashed lines).

## Special details

## Geometry. ENTER SPECIAL DETAILS OF THE MOLECULAR GEOMETRY

Refinement. Refinement was performed using all reflections. The weighted R -factor (wR) and goodness of fit (S) are based on $\mathrm{F}^{2}$. R-factor (gt) are based on F . The threshold expression of $\mathrm{F}^{2}>2.0 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating Rfactor (gt).
