Received 9 July 2015; accepted 30 October 2015

Edited by G. S. Nichol, University of Edinburgh, Scotland

In the crystal structure of the title compound, $\mathrm{C}_{12} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{NO}_{2}$, the mean planes through the quinoline and carboxylate groups have r.m.s. deviations of 0.006 and $0.021 \AA$, respectively, and form a dihedral angle of $87.06(19)^{\circ}$. In the crystal, molecules are linked via very weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming chains, which propagate along the $c$-axis direction.

Keywords: crystal structure; quinnoline; human immunodeficiency virus (HIV); hydrogen bonding.

## Crystal structure of ethyl 2,4-dichloroquinoline-3-carboxylate

Alberto Cabrera, Luis D. Miranda, Héctor Reyes, Gerardo Aguirre and Daniel Chávez

## S1. Chemical context

The HIV (human immunodeficiency virus) is responsible of the acquired immunodeficiency syndrome (AIDS). The actual treatment consists of a group of several drugs known as anti-retrovirals which inhibit important proteins for virus replication, including reverse transcriptase (Maartens et al., 2014).
As part of the synthesis of promising compounds as anti-retrovirals, Stammers and coworkers, maintaining as base structure a quinolone core, found compounds that showed activity in the inhibition of the reverse transcriptase. They obtained a dibromide quinolone in $\mathrm{C} 2 / \mathrm{C} 4$ as an intermediate. After that, they were able to remove the C 2 bromine in an acetic acid solution and finally, the C 4 bromine was substituted by alkyl-sulfurated compounds to get the final molecules which have been proven activity against HIV (Hopkins et al., 2004),

As part of our ongoing research, we have synthesized different pyridin-2 (1H)-one analogues (Reyes et al., 2013). In this work, we developed a methodology to obtain derivatives of quinolone, with saturated and unsaturated amines in in C4 with ethyl 4-hydroxy-2-oxo-1,2-dihydroquinoline-3-carboxilate as a starting material. Chlorination of the quinolone core results in the dichlorinated compound ethyl 2,4-dichloroquinoline-3-carboxylate with a yield of $70 \%$ and a crystal structure was obtained. The intermediate of interest, the ethyl 4-chloro-2-oxo-1,2-dihydroquinoline-3-carboxylate, was obtained after treatment of the dichlorinated compound with an acetic acid solution following the methodology described by Stammers (Hopkins et al., 2004) in $>98 \%$ yield (see experimental section in supplementary material).
The structure of the compound is shown in Fig. 1. The two aromatic rings of quinoline are fused almost coaxially, with a dihedral angle between their planes of $\mathrm{C} 8-\mathrm{C} 9-\mathrm{C} 10-\mathrm{C} 4=179.21(14)^{\circ}$. The carboxylate group is in an antiperiplanar conformation to the quinoline with a torsion angle $\mathrm{C} 12-\mathrm{O} 2-\mathrm{C} 11-\mathrm{C} 3=-179.39(15)^{\circ}$, and bonded to the quinoline over the plane $\mathrm{C} 3-\mathrm{C} 11-\mathrm{O} 2$ by $110.46(14)^{\circ}$. The deviation of the bond length values for $\mathrm{C} 2-\mathrm{Cl} 1=1.745(2)$ and $\mathrm{C} 4-$ $\mathrm{Cl} 2=1.7248$ (16) from the standard values can be attributed for the sp 2 hybridization of the quinoline ring. In the crystal, molecules are linked via $\mathrm{O} 1-\mathrm{H} 7$ intermolecular hydrogen bonds forming chains propagating along the $c$ axis direction. (Fig. 2).

## S2. Synthesis and crystallization

The synthesis of ethyl 2,4-dichloroquinoline-3-carboxylate and ethyl 4-chloro-2-oxo-1,2-dihydroquinoline-3-carboxylate includes reagents and reagent grade solvents, which were used without further purification. In a 100 mL round bottom flask equipped with a magnetic stirrer was placed 500 mg of ethyl 4-hydroxy-2-oxo-1,2-dihydroquinoline-3-carboxylate ( 2.15 mmol ) and 1.96 g of benzyltriethylammonium chloride in 15 mL of acetonitrile. Under continuous stirring, 0.88 mL of the phosphoryl chloride ( 9.46 mmol ) was added drop by drop. The mixture was stirred at $40^{\circ} \mathrm{C}$ for 30 min and later at reflux for 1 h . Then, the solvent was evaporated and 15 mL of cold water was added and stirred for 1 h . Then a precipitate was obtained corresponding to a mixture of ethyl 2,4-dichloroquinoline-3-carboxylate and ethyl 4-chloro-2-oxo-1,2-di-hydroquinoline-3-carboxylate. The precipitate was dissolved in 3 mL of dichloromethane-methanol ( $1: 1, \mathrm{v} / \mathrm{v}$ ). Partial
evaporation leads to crystals (not suitable for X-ray diffraction) of ethyl 4-chloro-2-oxo-1,2-dihydroquinoline-3carboxylate ( $0.65 \mathrm{mmol}, 30 \%$ ). The rest corresponded to ethyl 2,4 -dichloroquinoline-3-carboxylate ( $1.5 \mathrm{mmol}, 70 \%$ ). The latter compound was placed in a round bottom flask of 50 mL containing acetic acid ( 10 mL ) and water ( 5 mL ). The mixture was stirred under reflux for 24 h . After cooling, the product was extracted with ethyl ether to afford ethyl 4-chloro-2-oxo-1,2-dihydroquinoline-3-carboxylate ( $>98 \%$ ).
Ethyl 2,4-dichloroquinoline-3-carboxylate: m.p. $83-85^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ RMN (DMSO-d6): $\delta 8.27$ (dd, $J=8.3,0.6 \mathrm{~Hz}, \mathrm{H}-5$ ), 8.09 (dd, $J=8.3,0.6 \mathrm{~Hz}, \mathrm{H}-8), 8.03$ (ddd, $J=7.7,6.9,1.4 \mathrm{~Hz}, \mathrm{H}-7$ ), 7.89 (ddd, $J=7.7,6.9,1.4 \mathrm{~Hz}, \mathrm{H}-6) 4.51$ (q, $J=7.1 \mathrm{~Hz}$, $\mathrm{COOCH}_{2} \mathrm{CH}_{3}$ ), $1.39\left(\mathrm{t}, J=7.1 \mathrm{~Hz}, \mathrm{COOCH}_{2} \mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}$ RMN (DMSO-d6): $\delta 163.5,147.2,144.7,141.1,133.7,130.2$, 129.1, 127.1, 124.9, 124.3, 63.4, 14.3. IEMS m/e (int. rel): [M] 269 (32), [M] ${ }^{+}+2271$ (21), [M] $]^{+}+4273$ (3), 241 (26), 223 (100), 195 (17), 161 (28) amu.

Crystals of the title compound suitable for X-ray diffraction were obtained by dissolving 15 mg of ethyl 2,4-dichloro-quinoline-3-carboxylate in 0.5 mL of ethanol-di-ethyl ether ( $1: 1, \mathrm{v} / \mathrm{v}$ ) and placing the solution in a glass vial. The solution was allowed to stand at room temperature for 7 days and the crystals formed were filtered.

## S3. Refinement details

The C-bound H atoms were positioned geometrically and refined using a riding model with $\mathrm{d}(\mathrm{C}-\mathrm{H})=1.00 \AA, \mathrm{U}_{\text {iso }}=$ 1.2Ueq $(\mathrm{C})$ for $\mathrm{Csp}^{3}-\mathrm{H}, \mathrm{d}(\mathrm{C}-\mathrm{H})=0.99 \AA, \mathrm{U}_{\text {iso }}=1.2 \mathrm{Ueq}(\mathrm{C})$ for $\mathrm{CH}_{2}$ groups, $\mathrm{d}(\mathrm{C}-\mathrm{H})=0.95 \AA, \mathrm{U}_{\text {iso }}=1.2 \mathrm{Ueq}(\mathrm{C})$ for aromatic $\mathrm{C}-\mathrm{H}$.

Extinction coefficient: 0.010 (2)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
