Received 2 December 2015; accepted 12 December 2015

Edited by M. Nieger, University of Helsinki, Finland

The title compound, $\left[\mathrm{SnBr}_{4}\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~S}_{2}\right)\right]$ \{systematic name: catenapoly $\left[\right.$ tetrabromidotin(IV)] $-\mu$-1,4-dithiane- $\left.\left.\kappa^{2} S: S^{\prime}\right]\right\}$, represents the first 1,4-dithiane complex with tin as coordination centre. The asymmetric unit consist of half a formula unit with the $\operatorname{tin}(\mathrm{IV})$ atom at the centre of symmetry at $0,0,1 / 2$ (Wyckoff symbol $b$ ) and a centrosymmetric 1,4 -dithiane molecule with the centre of symmetry in $1 / 2,0,1$ (Wyckoff symbol $c$ ). The $\operatorname{tin}(\mathrm{IV})$ atom is coordinated in a distorted octahedral manner by the four bromine atoms and two sulfur atoms of two 1,4dithiane molecules in a trans-position. $\mathrm{Sn}-\mathrm{Br}$ [mean value: 2.561 (5) $\AA$ ] and $\mathrm{Sn}-\mathrm{S}$ distances [2.6546 (6) $\AA$ ] are in the typical range for octahedrally coordinated tin(IV) atoms and the dithiane molecule adopts a chair conformation. The onedimensional polymeric chains propagate along the [101] direction with weak intermolecular $\mathrm{Br} \cdots \operatorname{Br}[3.5724$ (4) Å] between parallel chains and weak $\mathrm{Br} \cdots \mathrm{H}$ interactions [2.944$2.993 \AA$ A within the chains.

Keywords: crystal structure; tin(IV) bromide; 1,4-dithiane; coordination polymer; $\mathrm{Br} \cdots \mathrm{Br}$ interactions; $\mathrm{Br} \cdots \mathrm{H}$ interactions.

# Crystal structure of a one-dimensional coordination polymer of tin(IV) bromide with 1,4-dithiane 

Hans Reuter, Natalia Röwekamp-Krugley, Marius Imwalle, Simona Keil and Martin Reichelt

## S1. Synthesis and crystallization

A mixture of $0.55 \mathrm{~g}(2 \mathrm{mmol}) \mathrm{SnBr}_{2}$ and $0.24 \mathrm{~g}(2 \mathrm{mmol})$ 1,4-dithiane was heated in a closed ampule to $130{ }^{\circ} \mathrm{C}$ for 6 hours. No special care was taken to exclude oxygen or humidity. After cooling, the ampule was opened and its solid content inspected by optical microscopy. Only one fragment, a yellow needle-like crystal of the title compound proved to be suitable for single crystal X-ray diffraction. The presence of $\operatorname{tin}(I V)$ in the title compound instead of tin(II) demonstrates the complexity of reactions that must have taken place. Sensitivity of $\operatorname{tin}$ (II) compounds towards oxidation by air, however, is not unusual and well documented in literature (e.g. Deacon et al, 1997).

## S1.1. Refinement

All hydrogen atoms could be localized in difference Fourier syntheses but were refined in geometric positions riding on the carbon atoms with $\mathrm{C}-\mathrm{H}$ distances of $0.99 \AA\left(-\mathrm{CH}_{2}-\right)$ and one common, free refined isotropic displacement factor.

## S2. Results and discussion

Only some few coordination compounds of tin(IV) bromide with Lewis-bases containing two or more S-atoms as Lewisbase centers have been structurally characterized. The main structural features are one-dimensional chain structures in case of macrocyclic thioether complexes (Levason et al., 2003) with the Lewis-base molecules in a cis- , and transposition, respectiveley, and the formation of monomeric complexes as a result of chelatization in case of open chain dithioether molecules (Dann et al., 1996). In all cases, the tin atoms are octahedrally coordinated with similar $\mathrm{Sn}-\mathrm{Br}$ and $\mathrm{Sn}-\mathrm{S}$ bond lengths.

Figure 1
Ball-and-stick model of the asymmetric unit of the title compound with the atomic numbering scheme used. For a better understanding the asymmetric unit of the 1,4-dithiane molecule has been extended by its symmetry-related atoms generated by the centre of symmetry $i$ (black dot) at $1 / 2,0,1$. With exception of the H atoms, which are shown as spheres of arbitrary radius, all atoms are drawn as displacement ellipsoids at the $50 \%$ probability level.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
