## Crystal structure of 1,2,3,4-di-O-methyl-ene- $\alpha$-d-galactopyranose

Ioannis Tiritiris, Stefan Tussetschläger and Willi Kantlehner*<br>Fakultät Chemie/Organische Chemie, Hochschule Aalen, Beethovenstrasse 1, D-73430 Aalen, Germany. *Correspondence e-mail: willi.kantlehner@hs-aalen.de

Received 9 November 2015; accepted 16 November 2015

Edited by M. Zeller, Youngstown State University, USA

The title compound, $\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{O}_{6}$, was synthesized by deacetylation of 6 -acetyl-1,2,3,4-di- $O$-methylene- $\alpha$-d-galactose with sodium methoxide. The central part of the molecule consists of a six-membered $\mathrm{C}_{5} \mathrm{O}$ pyranose ring with a twist-boat conformation. Both fused dioxolane rings adopt an envelope conformation with C and O atoms as the flap. In the crystal, $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds are present between adjacent molecules, generating a three-dimensional network.

Keywords: crystal structure; deacetylation; D-galactose; $\mathrm{O} — \mathrm{H} \cdots \mathrm{O}$ hydrogen bonds; C—H...O hydrogen bonds.

## Crystal structure of 1,2,3,4-di-O-methylene- $\alpha$-d-galactopyranose

Ioannis Tiritiris, Stefan Tussetschläger and Willi Kantlehner

## S1. Comment

The synthesis of the protected sugar 1,2,3,4-di- $O$-methylene- $\alpha$ - $D$-galactopyranose has been well known for many years (Bok et al., 1952). Its crystal structure, however, remained undetermined. According to the structure analysis of the title compound, which we would like to report now, the central part of the molecule consists of a six-membered $\mathrm{C}_{5} \mathrm{O}$ ring, which is made up from the carbon atoms $\mathrm{C} 1-\mathrm{C} 5$ and O 1 (Fig. 1). The chiral carbon atoms $\mathrm{C} 1 / \mathrm{C} 2 / \mathrm{C} 4 / \mathrm{C} 5$ of the pyranose part show $R$-configuration and C 3 shows S -configuration, in agreement with the expected configurations for an $\alpha-D-$ galactose ring. Both fused dioxolane rings adopt an envelope conformation with the carbon atom C 7 (ring I) and oxygen atom O3 (ring II) as the flap, respectively. The pyranose ring shows a twist-boat conformation. A similar conformation of the pyranose ring has been observed in 6-[bis(ethoxycarbonyl)methyl]-6-deoxy-1,2;3,4-di- $O$-isopropylidene- $D$-galactopyranose (Doboszewski et al., 2010). The $\mathrm{C}-\mathrm{O}$ and $\mathrm{C}-\mathrm{C}$ and bond lengths in the molecule are comparable with the data from the crystal structure analysis of 1,2,3,5-di- $O$-methylene- $\alpha$ - $D$-xylofuranose (Tiritiris et al., 2015a) and other related compounds [see, for example: 6- $O$-cyanomethyl-1,2:3,4-di- $O$-isopropylidene- $\alpha$ - $D$-galactose (Langer et al., 2005), and the $\alpha$ - and $\beta$-anomers of $D$-galactose (Sheldrick, 1976)]. In the crystal structure, $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds between adjacent molecules are present $[d(H \cdots \mathrm{O})=2.01(3) \AA$ (Tab. 1), generating infinite one-dimensional chains with base vector [100] (Fig. 2). Taking additional $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds between adjacent molecules $[d(\mathrm{H} \cdots \mathrm{O})=2.45-2.56 \AA]$ (Tab. 1) into account, a three-dimensional network is generated (Fig. 3).

## S2. Experimental

According to the literature (Bok et al., 1952) a solution of $25 \mathrm{~g}(139 \mathrm{mmol})$ D-galactose in 20 ml water was mixed with 100 ml glacial acetic acid. $27.5 \mathrm{~g}(916 \mathrm{mmol})$ paraformaldehyde was then added at room temperature. Followed by dropwise addition of 12.5 ml concentrated sulfuric acid, the reaction mixture was heated to 373 K for one hour. After subsequent cooling to room temperature, 100 ml water was added to the mixture. The solution was extracted three times with chloroform and the combined extracts were washed with water and dried over sodium sulfate. After evaporation of the solvent, the crude product was destilled under reduced presure using a 20 cm Vigreux column. The fraction at 407 K ( 0.1 mbar ) contained $4.28 \mathrm{~g}(13 \%)$ of 6 -acetyl-1,2,3,4-di- $O$-methylene- $\alpha-D$-galactose as the product. To a heated solution of $2.96 \mathrm{~g}(12 \mathrm{mmol}) 6$-acetyl-1,2,3,4-di- $O$-methylene- $\alpha$ - $D$-galactose (Bok et al., 1952) in 25 ml me thanol, 50 mg of sodium methoxide was added. After subsequent cooling to room temperature, 50 ml water was added to the mixture. The solution was extracted two times with diethyl ether and the combined extracts were dried over sodium sulfate. After evaporation of the solvent, the crude product was distilled under reduced presure using a 20 cm Vigreux column. The fraction at 395 K ( 0.1 mbar ) contained $1.6 \mathrm{~g}(66 \%)$ of the title compound, which crystallized spontaneously after several days at room temperature, forming colorless single crystals suitable for X-ray analysis.

## S3. Refinement

The O-bound H atom was located in a difference Fourier map and was refined freely [ $\mathrm{O} 2 — \mathrm{H} 12=0.87$ (3) $\AA$ ]. The title compound crystallizes in the non-centrosymmetric space group $P 2_{1} 2_{2} 2_{l}$; however, in the absence of significant anomalous scattering effects, the Flack parameter is essentially meaningless and the absolute configuration was chosen based on known stereocenters unchanged during synthesis. The H atoms in $\mathrm{CH}_{2}$ and CH groups were placed in calculated positions with $\mathrm{d}(\mathrm{C}-\mathrm{H})=0.99 \AA$ and $\mathrm{d}(\mathrm{C}-\mathrm{H})=1.00 \AA$ and refined using a riding model, with $U_{\mathrm{eq}}(\mathrm{H})$ set to $1.2 U_{\mathrm{eq}}(\mathrm{C})$.

Figure 1
The structure of the title compound with displacement ellipsoids at the $50 \%$ probability level.

Figure 2
$\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (black dashed lines) between adjacent molecules in the crystal structure of the title compound (ac view).

Figure 3
$\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H}^{\cdots} \mathrm{O}$ hydrogen bonds (black dashed lines) between adjacent molecules in the crystal structure of the title compound (ac view).

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
