The synthesis, structure, and magnetic properties of lithium dibarium calcium oxide fluoride disulfide are reported. $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143(4)} \mathrm{Bi}_{0.857(4)} \mathrm{S}_{2}$ crystallizes in the tetragonal space group $P 4 / n m m$. The structure exhibits disorder of the $\mathrm{Ca}^{2+}$ and $\mathrm{Bi}^{3+}$ cations, and the $\mathrm{O}^{2-}$ and $\mathrm{F}^{-}$anions. The structure is composed of a stacking of $\left[(\mathrm{O}, \mathrm{F})_{2} \mathrm{La}_{2}\right]$ layers and double $\left[(\mathrm{Bi}, \mathrm{Ca}) \mathrm{S}_{2}\right]$ layers. Magnetic property measurements indicate a very small magnetization at 300 K and the existence of weak ferromagnetism at 2 K .

## 1. Chemical context

Layered crystal structures seem to be a common stage on which to explore superconductivity (Vershinin et al., 2004; Kamihara et al., 2008; Chen et al., 2008; Fang et al., 2010). The discovery of $\left[\mathrm{Fe}_{2} A n_{2}\right](A n=\mathrm{P}$, As, $\mathrm{S}, \mathrm{Se}$ or Te$)$ and $\left[\mathrm{CuO}_{2}\right]$ superconducting layers has opened a new field in physics and chemistry for the exploration of low-dimensional superconductivity. Recently, superconductivity with transition temperatures of 4.5 K was reported in the $\mathrm{BiS}_{2}$-based compound $\mathrm{Bi}_{4} \mathrm{O}_{4} \mathrm{~S}_{3}$ (Singh et al., 2012). Soon after, $\operatorname{Ln} \mathrm{O}_{1-}$ ${ }_{x} \mathrm{~F}_{x} \mathrm{BiS}_{2}(L n=\mathrm{La}, \mathrm{Ce}, \operatorname{Pr}$ and Nd$)$, were reported to be superconducting with transition temperatures $T_{\mathrm{c}}$ of $3-10.6 \mathrm{~K}$ (Nagao et al., 2013; Demura et al., 2013). The mother $\mathrm{BiS}_{2^{-}}$ based layered compound $A e \mathrm{FBiS}_{2}(A e=\mathrm{Ca}, \mathrm{Sr}$ or Ba ; Lei et al., 2013; Han et al., 2008) is isostructural to $\operatorname{LnOBiS}$, with the $\left[L_{2} \mathrm{O}_{2}\right]^{2-}$ layer being replaced by an isocharged $\left[\mathrm{Sr}_{2} \mathrm{~F}_{2}\right]^{2-}$ block. The parent phase of $\mathrm{SrFBiS}_{2}$ shows semiconducting behavior, but electron-doped $\mathrm{Sr}_{0.5} \mathrm{La}_{0.5} \mathrm{FBiS}_{2}$ has a superconducting transition of 2.8 K (Lin et al., 2013). Herein the synthesis, structure and magnetic properties of $\mathrm{LaCa}_{0.143 \text { (4) }} \mathrm{O}_{0.857 \text { (4) }} \mathrm{F}_{0.143 \text { (4) }} \mathrm{Bi}_{0.857 \text { (4) }} \mathrm{S}_{2}$ are reported.

## 2. Structural commentary

We attempted to prepare the Ca and F double-doped compound $\mathrm{La}_{1-x} \mathrm{Ca}_{x} \mathrm{O}_{1-2 x} \mathrm{~F}_{2 x} \mathrm{BiS}_{2}$, but the results indicate the single-crystal composition is $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143 \text { (4)- }}$ $\mathrm{Bi}_{0.857(4)} \mathrm{S}_{2}$. An SEM image shows thick plate-shaped crystals of $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143(4)} \mathrm{Bi}_{0.857(4)} \mathrm{S}_{2}$ (Fig. 1). $\mathrm{LaO}_{1-x} \mathrm{~F}_{x^{-}}$ $\mathrm{BiS}_{2}$ crystals usually show a thin-sheet shape (Fig. 2). From the EDXS analysis, we obtained the elemental components of La, $\mathrm{Ca}, \mathrm{Bi}, \mathrm{S}, \mathrm{F}$ and O . The final composition was obtained by structure refinement (details can be seen in the Refinement section).

Figure 1
SEM image of $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143(4)} \mathrm{Bi}_{0.857(4)} \mathrm{S}_{2}$.

Figure 2
SEM image of $\mathrm{LaO}_{0.6} \mathrm{~F}_{0.4} \mathrm{BiS}_{2}$.

The structure of $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143(4)} \mathrm{Bi}_{0.857(4)} \mathrm{S}_{2}$, shown in Fig. 3, is composed of a stacking of $\left[(\mathrm{O}, \mathrm{F})_{2} \mathrm{La}_{2}\right]$ layers and double $\left[(\mathrm{Bi}, \mathrm{Ca}) \mathrm{S}_{2}\right]$ layers as in $\mathrm{LaO}_{1-x} \mathrm{~F}_{x} \mathrm{BiS}_{2}$. The double $\left[(\mathrm{Bi}, \mathrm{Ca}) \mathrm{S}_{2}\right]$ layers show $\mathrm{Bi} 1 / \mathrm{Ca} 1-\mathrm{S} 2$ distances of 2.8672 (6) $\AA$ representing equatorial bonds and $\mathrm{Bi} 1 / \mathrm{Ca} 1-\mathrm{S} 1$ distances of 2.530 (3) A representing axial bonds; these are a little shorter than the $\mathrm{Bi} 1-\mathrm{S} 1$ distance of $2.87476(15)$ and $\mathrm{Bi} 1-\mathrm{S} 2$ distance of $2.530(6) \AA$ in $\mathrm{LaO}_{1-x} \mathrm{~F}_{x} \mathrm{BiS}_{2}$. The $\left[(\mathrm{O}, \mathrm{F})_{2} \mathrm{La}_{2}\right]$ layers exhibit O1/F1 - La1 bond lengths of 2.4414 (6) $\AA$ and La1-O1/F1-La1 bond angles of 108.08 (2) and 112.29 (4) ${ }^{\circ}$, which are close to the $\mathrm{La}-\mathrm{O} / \mathrm{F}$ bond length of 2.4402 (8) $\AA$ and $\mathrm{La} 1-\mathrm{O} 1 / \mathrm{F} 1-\mathrm{La} 1$ bond angles of $107.82(3)$ and $112.82(6)^{\circ}$ in $\mathrm{LaO}_{1-x} \mathrm{~F}_{x} \mathrm{BiS}_{2}$. The ionic radius of $\mathrm{Ca}^{2+}$ is 114 pm which is a little shorter than that of $117.2 / 117 \mathrm{pm}$ for $\mathrm{La}^{3+} / \mathrm{Bi}^{3+}$. The distinct reduced $\mathrm{Bi} 1 / \mathrm{Ca} 1-\mathrm{S} 2$ distances in the title compound reflect the fact that Ca substitutes Bi sites rather than La sites.

## 3. Magnetic property measurements

The magnetization versus temperature under a 1 T field for the title compound is given in Fig. 4. Magnetization versus magnetic field is given in Fig. 5 for fields ranging from -5 to 5 T at 2 K and 300 K . The magnetic properties indicate weak ferromagnetism at 2 K and a very low magnetization at 300 K . The superconducting transition is not observed in the measured temperature range. This might be related to the Ca substitution of the Bi site in the title compound. For superconducting $\mathrm{LaO}_{1-x} \mathrm{~F}_{x} \mathrm{BiS}_{2}$ crystals, the density of states at the Fermi level is mainly directed by the $\mathrm{Bi} p$ orbital. $\left[\mathrm{BiS}_{2}\right]$ layers play a vital role in the transport and superconducting properties. The Ca substitution of the Bi site leads to a hole doping which changed the electronic band structure and density of state of $\mathrm{LaO}_{1-x} \mathrm{~F}_{x} \mathrm{BiS}_{2}$. Another reason might be the reduced F content in $\mathrm{LaCa}_{0.143 \text { (4) }} \mathrm{O}_{0.857 \text { (4) }} \mathrm{F}_{0.143(4)} \mathrm{Bi}_{0.857 \text { (4) }} \mathrm{S}_{2}$ compared with $\mathrm{LaO}_{1-x} \mathrm{~F}_{x} \mathrm{BiS}_{2}$.

## 4. Database survey

$L n \mathrm{O}_{1-x} \mathrm{~F}_{x} \mathrm{BiS}_{2}(L n=\mathrm{La}, \mathrm{Ce}, \mathrm{Pr}$ and Nd$)$ compounds were reported by Nagao et al. (2013) and Demura et al. (2013).

Figure 3
Crystal structure of $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143(4)} \mathrm{Bi}_{0.857}{ }_{(4)} \mathrm{S}_{2}$, showing $\left[(\mathrm{O}, \mathrm{F})_{2} \mathrm{La}_{2}\right]$ layers and double $\left[\mathrm{BiS}_{2}\right]$ layers $(\mathrm{O} / \mathrm{F}$ in red, La in blue, $\mathrm{Bi} /$ Ca in pink and S in yellow; $50 \%$ probability ellipsoids).

Figure 4
Magnetic moment versus temperature for $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143 \text { (4)- }}$ $\mathrm{Bi}_{0.857 \text { (4) }} \mathrm{S}_{2}$ under a 1 T field.
$A e \mathrm{FBiS}_{2}(A e=\mathrm{Ca}, \mathrm{Sr}, \mathrm{Ba})($ Lei et al., 2013; Han et al., 2008) are isostructural to $\mathrm{Ln} \mathrm{OBiS}_{2}$. The doped $\mathrm{Sr}_{0.5} \mathrm{La}_{0.5} \mathrm{FBiS}_{2}$ ( Lin et al., 2013) is isostructural to $\mathrm{AeFBiS}_{2}$.

## 5. Synthesis and crystallization

$\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857 \text { (4) }} \mathrm{F}_{0.143 \text { (4) }} \mathrm{Bi}_{0.857 \text { (4) }} \mathrm{S}_{2}$ was prepared using of $\mathrm{Bi}_{2} \mathrm{O}_{3}, \mathrm{CaF}_{2}, \mathrm{La}_{2} \mathrm{~S}_{3}, \mathrm{Bi}_{2} \mathrm{~S}_{3}$ and Bi raw materials. The mixtures with a nominal composition of $\mathrm{La}_{0.85} \mathrm{Ca}_{0.15} \mathrm{O}_{0.70} \mathrm{~F}_{0.30} \mathrm{BiS}_{2}$ were ground, pressed into pellets, sealed in an evacuated quartz tube, and heated at 1073 K for 3 d . High-quality single crystals were grown by using KI as the flux. Nominal $\mathrm{La}_{0.85} \mathrm{Ca}_{0.15} \mathrm{O}_{0.70} \mathrm{~F}_{0.30} \mathrm{BiS}_{2}$ and KI in the molar ratio of $1: 3$ were

Multi-scan (SADABS; Bruker, 2001)

Computer programs: APEX2 and SAINT (Bruker, 2004), SHELXS (Sheldrick, 2008), SHELXL2014 (Sheldrick 2015), DIAMOND (Brandenburg, 2004) and publCIF (Westrip, 2010).
mixed and placed in a quartz tube, which was sealed and heated to 1273 K and kept at this temperature for 1 d , then cooled to room temperature in 10 d . The product was washed with distilled water and acetone, then dried at 353 K for 12 h ; finally black plate-shaped crystals were obtained.

The morphology and element compositions were investigated by a scanning electronic microscope equipped with an energy dispersive X-ray spectroscopy (EDXS, Oxford Instruments). The EDXS shows the atom \% ratio for S:Ca:La:Bi to be 48.23: 6.94: 24.36: 20.48. O and F could not be determined precisely. Magnetic properties were measured on a multifunctional physical properties measurement system (PPMS, Quantum Design).

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 1. The $\mathrm{La}, \mathrm{Bi}, \mathrm{S}$ and O atoms were located in difference maps and their positions were freely refined. Ca was assumed at La sites at first, but the refinement show no reducing occupancy of La. The partial occupancy of Bi indicates a mixed occupancy with $\mathrm{Ca} . \mathrm{Ca}$ and Bi were refined together later. EDXS measurements could not determine occupancies of $O$ and $F$ precisely. If the occupancies of $F$ and O are refined together, the obtained composition is $\mathrm{La}_{2} \mathrm{Bi}_{1.859 \text { (4) }} \mathrm{Ca}_{0.141(4)} \mathrm{O}_{0.48 \text { (14) }} \mathrm{F}_{0.52(14)} \mathrm{S}_{4}$ with high standard errors for O and F . In order to keep charge neutrality, the occupancy of F was fixed to be the same as Ca so the final composition of $\mathrm{LaCa}_{0.143(4)} \mathrm{O}_{0.857(4)} \mathrm{F}_{0.143(4)} \mathrm{Bi}_{0.857(4)} \mathrm{S}_{2}$ was obtained.

## supporting information

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
