The title compound, $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$, crystallizes with two independent molecules ( $A$ and $B$ ) in the asymmetric unit that differ in the orientation of the 3-methoxyphenyl group with respect to the methylidenebenzohydrazide unit. The dihedral angles between the two benzene rings are 24.02 (10) and $29.30(9)^{\circ}$ in molecules $A$ and $B$, respectively. In molecule $A$, the methoxy group is twisted slightly relative to its bound benzene ring, with a $\mathrm{C}_{\text {methyl }}-\mathrm{O}-\mathrm{C}-\mathrm{C}$ torsion angle of $14.2(3)^{\circ}$, whereas it is almost co-planar in molecule $B$, where the corresponding angle is $-2.4(3)^{\circ}$. In the crystal, the molecules are linked by $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}, \mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, as well as by weak $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ interactions, forming sheets parallel to the $b c$ plane. The $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond and weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interaction link different molecules $(A \cdots B)$ whereas both $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link like molecules $(A \cdots A)$ and $(B \cdots B)$. Pairs of inversion-related $B$ molecules are stacked approximately along the $a$ axis by $\pi-\pi$ interactions in which the distance between the centroids of the 3 -methoxyphenyl rings is 3.5388 (12) $\AA$. The $B$ molecules also participate in weak $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions between the 4-hydroxyphenyl and the 3-methoxyphenyl rings.

## 1. Chemical context

The benzohydrazide pharmacophore, which comprises $>\mathrm{C}=\mathrm{O},>\mathrm{C}=\mathrm{N}-$ and $>\mathrm{NH}$ groups, has attracted much attention from medicinal chemists as a result of its important biological properties. Various derivatives of benzohydrazide have been reported to possess a range of biological properties, including antibacterial (Bhole \& Bhusari, 2009; Peng, 2011), antifungal (Loncle et al., 2004), antitubercular (Bedia et al., 2006) and antimalarial activities (Melnyk et al., 2006). Recently, $\alpha$-glucosidase inhibitory activity of benzohydrazides has been reported (Imran et al., 2015; Taha et al., 2015).

The interesting biological activities of benzohydrazides led us to synthesize the title compound (I) and study its $\alpha$ glucosidase inhibitory activity. The result indicates that (I) possesses weak $\alpha$-glucosidase inhibitory activity with $7.30 \pm 2.85 \%$ inhibition at a concentration of $100 \mu \mathrm{~g} / \mathrm{mL}$. The structure of (I) was characterized by spectroscopy while its X-ray structure, Fig. 1, confirms the formation of the $N^{\prime}$-benzylidenebenzohydrazide skeleton. In our previous studies, we reported the syntheses and crystal structures of two related compounds, ( $E$ )-4-hydroxy- $N^{\prime}$-(3-hydroxy-4-methoxybenzylidene) benzohydrazide (Fun et al., 2011) and (E)-4-hy-
droxy- $N^{\prime}$-(3,4,5-trimethoxybenzylidene)benzohydrazide (Horkaew et al., 2011).

## 2. Structural commentary

There are two crystallographically independent molecules, $A$ and $B$, of the title benzohydrazide derivative, $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$, in the asymmetric unit of (I). These differ in the orientation of the 3-methoxyphenyl ring with respect to the methylidenebenzohydrazide unit. The dihedral angles between the two benzene rings are 24.02 (10) and $29.30(9)^{\circ}$ in molecules $A$ and $B$, respectively. The molecules exist in the trans-conformation with respect to the $\mathrm{C} 8=\mathrm{N} 2$ bond $[1.275$ (2) $\AA$ in molecule $A$ and 1.271 (2) $\AA$ in molecule $B$ ] and the torsion angle $\mathrm{N} 1-$ $\mathrm{N} 2-\mathrm{C} 8-\mathrm{C} 9=-178.14(16)^{\circ}$ in molecule $A$ and $-177.69(16)^{\circ}$ in molecule $B$. Five atoms (O1, C7, N1, N2 and $\mathrm{C} 8)$ of the central fragment are approximately coplanar, having r.m.s. deviations of 0.0179 (2) $\AA$ in molecule $A$ and 0.0327 (2) $\AA$ in molecule $B$. The mean plane through this central fragment makes dihedral angles of 23.87 (11) and $0.20(12)^{\circ}$ with the planes of the 4-hydroxyphenyl and 3-methoxyphenyl rings, respectively, in molecule $A$. The corresponding values are 22.58 (11) and 11.04 (11) ${ }^{\circ}$ in molecule $B$. In molecule $A$, the methoxy group is slightly twisted from the attached benzene ring $[\mathrm{C} 15-\mathrm{O} 3-\mathrm{C} 11-\mathrm{C} 10=$

Table 1

Symmetry codes: (i) $-x,-y+1,-z+1$; (ii) $x,-y+\frac{3}{2}, z-\frac{1}{2}$; (iii) $x,-y+\frac{1}{2}, z-\frac{1}{2}$; (iv) $x, y+1, z ;(\mathrm{v})-x, y-\frac{1}{2},-z+\frac{3}{2}$.
$14.2(3)^{\circ}$ ] whereas it is essentially coplanar in molecule $B$ [where the corresponding torsion angle is $-2.4(3)^{\circ}$ ]. The bond distances agree with literature values and are comparable with those in related structures (Fun et al., 2011; Horkaew et al., 2011; Rassem et al., 2012; Shi, 2009).

## 3. Supramolecular features

In the crystal (Fig. 2), the molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$, $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, as well as by weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions (Table 1), into sheets parallel to the $b c$ plane. The $\mathrm{N} 1 A-\mathrm{H} 1 A \cdots \mathrm{O} 2 B^{\mathrm{i}}$ and $\mathrm{N} 1 B-\mathrm{H} 1 B \cdots \mathrm{O} 3 A^{\mathrm{ii}}$ hydrogen bonds and $\mathrm{C} 13 B-\mathrm{H} 13 B \cdots \mathrm{O} 1 A^{\text {iv }}$ interactions link non-equivalent molecules $(A \cdots B)$ whereas the $\mathrm{O} 2 A-$ $\mathrm{H} 2 A \cdots \mathrm{~N} 2 A^{\mathrm{iii}}$ and $\mathrm{O} 2 A-\mathrm{H} 2 A \cdots \mathrm{O} 1 A^{\mathrm{iii}}$ hydrogen bonds link equivalent $A$ molecules, and $\mathrm{O} 2 B-\mathrm{H} 2 B \cdots \mathrm{~N} 2 B^{\mathrm{ii}}$ and $\mathrm{O} 2 B-$ $\mathrm{H} 2 B \cdots \mathrm{O} 1 B^{\mathrm{ii}}$ hydrogen bonds link equivalent $B$ molecules. Stacking of planes of molecules in the $a$-axis direction involves $\pi-\pi$ interactions between $B$ molecules with $C g \cdots C g^{\text {vi }}$ distance

Figure 1
The molecular structure of (I), showing $50 \%$ probability displacement ellipsoids and the atom-numbering scheme.

Figure 2
Molecular packing of (I) linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}, \mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds drawn as dotted lines.
of $3.5388(12) \AA$. A weak $\mathrm{C}-\mathrm{H} \cdots \pi$ interaction (C3B$\mathrm{H} 3 B \cdots C g^{\mathrm{v}}$ ) between the 4-hydroxyphenyl ring and the 3-methoxyphenyl ring of symmetry-related $B$ molecules is also present (Fig. 3, Table 1) [symmetry codes: (i) $-x, 1-y, 1-z$; (ii) $x, \frac{3}{2}-y,-\frac{1}{2}+z$; (iii) $x, \frac{1}{2}-y,-\frac{1}{2}+z$; (iv) $x, 1+y, z ;$ (v) $-x$,

Figure 3

$-\frac{1}{2}+y, \frac{3}{2}-z ;$ (vi) $1-x, 2-y, 2-z ; C g$ is the centroid of the C9B-C14B ring].

## 4. Database survey

A search of SciFinder (Scifinder, 2015) reveals a total of 719 related structures with benzohydrazides, and 52 related structure with 4-hydroxybenzohydrazides. Specific examples by Fun et al., 2011; Horkaew et al., 2011; Rassem et al., 2012; Shi, 2009) have been mentioned in the Chemical context section.

## 5. Synthesis and crystallization

A solution of 4-hydroxybenzohydrazide ( $2 \mathrm{mmol}, 0.30 \mathrm{~g}$ ) in ethanol ( 10 ml ) and 3-methoxybenzaldehyde ( $2 \mathrm{mmol}, 0.27 \mathrm{~g}$ ) in ethanol ( 10 ml ) were mixed, stirred and refluxed for 5 h . The resulting mixture was then cooled to room temperature. The white precipitate that formed was filtered. Colorless block-shaped single crystals of (I) suitable for X-ray structure determination were recrystallized from methanol by slow evaporation at room temperature over a period of several days, m.p. 478-479 K.

## 6. Spectroscopic studies and $a$-glucosidase inhibitory assay

UV-Vis $\left(\mathrm{CH}_{3} \mathrm{OH}\right) \lambda_{\text {max }}(\log \varepsilon): 212(5.51), 302(5.61) \mathrm{nm} ;$ FTIR (KBr) v: 3158, 2834, 1648, 1607, $1509 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 300 MHz, DMSO- $d_{6}$ ) $\delta: 11.65(s, 1 \mathrm{H}, \mathrm{NH}), 10.15(s, 1 \mathrm{H}, \mathrm{Ar}-$ $\mathrm{OH}), 8.39(s, 1 \mathrm{H}, \mathrm{N}=\mathrm{CH}), 7.80(d, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{H})$, $7.27(s, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.25(b r d, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.37(t$, $J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.00(b r d, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H})$, $6.86(d, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 3.81$ ( $s, 3 \mathrm{H},-\mathrm{OCH} 3$ ) p.p.m.

The UV-Vis spectrum of (I) shows absorption bands of a benzohydrazide ( 212 and 302 nm ). The IR spectrum of (I) shows the typical stretching of $\mathrm{C}=\mathrm{N}$ and amide $\mathrm{C}=\mathrm{O}$ functionalities at 1648 and $1607 \mathrm{~cm}^{-1}$, respectively, which confirm the successful synthesis of the $N^{\prime}$-benzylidenebenzohydrazide skeleton. In addition, the ${ }^{1} \mathrm{H}$ NMR spectrum of (I) also supports the formation of the $N^{\prime}$-benzylidenebenzohydrazide skeleton by showing the characteristic signals of an amine $(\mathrm{N}=\mathrm{CH})$ at $8.39(s, 1 \mathrm{H})$ and an amide $(\mathrm{N}-\mathrm{H})$ at $11.65(s, 1 \mathrm{H})$ p.p.m.

The $\alpha$-glucosidase inhibitory assay was modified from the method of Kim et al. (2004). The result showed that (I) possesses weak activity with $7.30 \pm 2.85 \%$ inhibition at a concentration of $100 \mu \mathrm{~g} / \mathrm{mL}$.

## 7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Hydrogen atoms were positioned geometrically and allowed to ride on their parent atoms, with $d(\mathrm{~N}-\mathrm{H})=0.85$ or $0.87 \AA ; \mathrm{d}(\mathrm{O}-\mathrm{H})=0.82 \AA ; \mathrm{d}(\mathrm{C}-\mathrm{H})=$ $0.93 \AA$ for aromatic and CH ; and $0.96 \AA$ for $\mathrm{CH}_{3}$ atoms. The $U_{\text {iso }}$ values were constrained to be $1.5 U_{\text {eq }}$ of the carrier atom

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional R-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
