In the crystal of 2-(4-chlorophenyl)- N -(2-iodophenyl)acetamide, $\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{CIINO}$, molecules are linked by a combination of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds to form a $C(4) C(4)\left[R_{2}^{1}(7)\right]$ chain of rings and chains of this type are linked by a combination of $\mathrm{C}-\mathrm{Cl} \cdots \pi$ (arene) and $\mathrm{C}-\mathrm{I} \cdots \pi$ (arene) interactions to form deeply puckered twofold interwoven sheets. In the crystal of 2-(4-chlorophenyl)-$N$-(pyrazin-2-yl)acetamide, $\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{ClN}_{3} \mathrm{O}$, molecules are linked into complex sheets by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, and by $\mathrm{C}-$ $\mathrm{H} \cdots \pi$ (arene) interactions.

## 1. Chemical context

Substituted acetamides of the type $R^{1} \mathrm{CH}_{2} \mathrm{CONH} R^{2}$, where $R^{1}$ and $R^{2}$ are aromatic or hetero-aromatic substituents, are of interest as they have some resemblance to benzyl penicillins (Pitt, 1952; Csöregh \& Palm, 1977; Kojić-Prodić \& RużoćToroš, 1978; Mijin \& Marinković, 2006; Mijin et al., 2008). Here we report on the molecular structures and supramolecular assembly of two such amides, compounds (I) and (II). The compounds were prepared by the reaction between (4-chlorophenyl)acetic acid and either 2-iodoaniline for (I), or 2-aminopyrazine for (II), using 1-ethyl-3-(3-dimethylamino-propyl)-carbodiimide hydrochloride as the coupling agent.

## 2. Structural commentary

The molecular conformations of compounds (I) and (II), illustrated in Figs. 1 and 2, respectively, can be defined in terms of the torsional angles $\mathrm{N} 1-\mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 21,141.8$ (3) and $129.22(18)^{\circ}$ respectively, and by the dihedral angles between the central spacer unit, atoms $\mathrm{N} 1, \mathrm{C} 1, \mathrm{O} 1, \mathrm{C} 2$, and the two independent rings. The dihedral angles to the chlorinated ring (C21-C26) are 80.02 (11) and 61.74 (6) $)^{\circ}$ in (I) and (II); those to the iodinated ring in (I) and the pyrazinyl ring in (II) are $67.48(11)$ and $5.86(11)^{\circ}$, respectively. This difference is probably associated with the participation in the intermolecular hydrogen bond of both N atoms of the pyrazinyl ring in (II), as discussed below. The molecules of (I) and (II) do not therefore exhibit any internal symmetry, so that they are conformationally chiral: the centrosymmetric space groups
confirm that each compound has crystallized as a conformational racemate.

(I)

(II)

In the pyrazine ring of compound (II) the four independent $\mathrm{C}-\mathrm{N}$ distances span a range of only $c a 0.01 \AA$, indicating that this ring is fully aromatic.

## 3. Supramolecular interactions

The hydrogen-bonded assembly in compound (I) is very simple: a combination of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1) links the molecules into a $C(4) C(4)\left[R_{2}^{1}(6)\right]$ chain of rings. This chain contains molecules which are related by a $c$-glide plane, producing a chain running parallel to the [001] direction (Fig. 3). There is also a $\mathrm{C}-\mathrm{H} \cdots \pi$ (arene) contact in compound (I) (Table 1), lying within the [001] chain,

Figure 1
The molecular structure of compound (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level.

$C g 2$ is the centroid of the $\mathrm{C} 21-\mathrm{C} 26$ ring.

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{~N} 1-\mathrm{H} 1 \cdots \mathrm{O}^{\mathrm{i}}$ | 0.86 | 2.06 | $2.908(3)$ | 167 |
| $\mathrm{C} 2-\mathrm{H} 2 A \cdots 1^{\mathrm{i}}$ | 0.97 | 2.58 | $3.420(4)$ | 145 |
| $\mathrm{C} 2-\mathrm{H} 2 B \cdots \mathrm{Cg}^{\mathrm{i}}$ | 0.97 | 2.99 | $3.589(3)$ | 121 |

Symmetry code: (i) $x,-y+\frac{1}{2}, z+\frac{1}{2}$.
but the dimensions make it unlikely that this has any structural significance. Two chains of this type, which are related to one another by inversion, pass through each unit cell, and a combination of $\mathrm{C}-\mathrm{I} \cdots \pi$ (arene) and $\mathrm{C}-\mathrm{Cl} \cdots \pi$ (arene) interactions links the chains into a sheet in the form of a $(4,4)$ net lying parallel to (100) (Fig. 4). The dimensions of these interactions are: for $\mathrm{C} 12-\mathrm{I} 12 \cdots \mathrm{Cg} 1^{\mathrm{i}}$ [symmetry code: (i) $x$, $\frac{3}{2}-y, \frac{1}{2}+z$, where $C g 1$ represents the centroid of the $\mathrm{C} 11-\mathrm{C} 16$ ] ring, $\mathrm{I} \cdots C g 3.7977(14), \mathrm{C} \cdots C g 5.082$ (3) $\AA$ and $\mathrm{C}-\mathrm{I} \cdots C g$ $116.34(8)^{\circ}$; for $\mathrm{C} 24-\mathrm{Cl} 24 \cdots \mathrm{Cg} 2^{\mathrm{ii}}$ [symmetry code: (ii) $x$, $-\frac{1}{2}-y,-\frac{1}{2}+z$, where $C g 2$ represents the centroid of the C21C26 ring], $\mathrm{Cl} \cdots C g 3.4557$ (8), C $\cdots C g 4.504$ (3) $\AA$ and $\mathrm{C}-$ $\mathrm{Cl} \cdots C g 116.19(11)^{\circ}$. The metrics of the $\mathrm{C}-\mathrm{Cl} \cdots C g$ interaction are well within the normal range, as deduced using database analysis (Imai et al., 2008).

Because the repeat unit of this sheet in the [010] direction spans two unit cells, there are in fact two such sheets present, related to one another by a unit translation along [010]: the deep puckering of the sheets (Fig. 5) means that the two independent sheets are interwoven. The structure of (I) also contains a short $\mathrm{I} \cdots \mathrm{O}$ contact with dimension $\mathrm{I} 12 \cdots \mathrm{O} 1^{\mathrm{i}}$

Figure 3
Part of the crystal structure of compound (I) showing the formation of a hydrogen-bonded chain of rings running parallel to the [001] direction. Hydrogen bonds are shown as dashed lines and, for the sake of clarity, the H atoms bonded to the C atoms which are not involved in the motif shown have been omitted. The atoms marked with an asterisk (*) or a hash (\#) are at the symmetry positions $\left(x, \frac{1}{2}-y, \frac{1}{2}+z\right)$ and $\left(x, \frac{1}{2}-y,-\frac{1}{2}+z\right)$, respectively.
$3.058(2) \AA$ and $\mathrm{C} 12-\mathrm{I} 12 \cdots \mathrm{O} 1^{\mathrm{i}} 170.88$ (8) ${ }^{\circ}$ [symmetry code: (i) $\left.x, \frac{3}{2}-y, \frac{1}{2}+z\right]$ which complements the $\mathrm{C}-\mathrm{Cl} \cdots C g$ contact. The I $\cdots$ O distance here is significantly shorter than the sum of the van der Waals radii, $3.56 \AA$ (Rowland \& Taylor, 1996), or $3.30 \AA$ if account is taken of the polar flattening model (Nyburg \& Faerman, 1985).

The hydrogen-bonded supramolecular assembly in compound (II) is more complex than that in compound (I): molecules of (II) are linked into complex sheets by a combination of $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, weakly augmented by two $\mathrm{C}-\mathrm{H} \cdots \pi$ (arene) hydrogen bonds (Table 2): hydrogen bonds of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ type, often observed in the structures of amides, are absent, however. The formation of this structure can readily be analysed in terms of two simple sub-structures in one- and two-dimensions (Ferguson et al., 1998a,b; Gregson et al., 2000). In the simpler of the sub-structures, a combination of N $\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds links molecules which are related by the $2_{1}$ screw axis along ( $x, \frac{3}{4}, \frac{1}{2}$ ) into a $C(4) C(5)\left[R_{2}^{2}(7)\right]$ chain of rings running parallel to the [100] direction (Fig. 6). A more complex one-dimensional sub-

Figure 4

For the sake of clarity, the H atoms have all been omitted.

Figure 5
A projection down [001] of one of the (100) sheets in the crystal structure of compound (I) showing the deep puckering of the sheet enabling interweaving. The $\mathrm{C}-X \cdots \pi$ (arene) interactions ( $X=\mathrm{Cl}$ or I ) are shown as thin tapered lines, and for the sake of clarity, the H atoms have all been omitted.

Figure 6
Part of the crystal structure of compound (II) showing the formation of a hydrogen-bonded chain of rings running parallel to the [010] direction and built from $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, shown as dashed lines. For the sake of clarity, the C-bound H atoms which are not involved in the motifs shown have been omitted. The atoms marked with an asterisk (*) or a hash (\#) are at the symmetry positions $\left(\frac{1}{2}+x, \frac{3}{2}-y\right.$, $1-z)$ and $\left(-\frac{1}{2}+x, \frac{3}{2}-y, 1-z\right)$, respectively.

Table 2
Hydrogen-bond geometry ( $\AA{ }^{\circ}{ }^{\circ}$ ) for (II).
$C g 2$ is the centroid of the C21-C26 ring.

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{~N} 1-\mathrm{H} 1 \cdots \mathrm{~N} 14^{\mathrm{i}}$ | $0.85(2)$ | $2.23(2)$ | $3.077(2)$ | $175(2)$ |
| $\mathrm{C}^{\mathrm{ii}}-\mathrm{H} 2 A \cdots \mathrm{O} 1^{\mathrm{ii}}$ | 0.97 | 2.57 | $3.461(3)$ | 153 |
| $\mathrm{C} 13-\mathrm{H} 13 \cdots \mathrm{~N} 11^{\mathrm{iii}}$ | 0.93 | 2.50 | $3.277(2)$ | 142 |
| ${\mathrm{C} 22-\mathrm{H} 22 \cdots C 2^{\mathrm{ii}}}^{\mathrm{C} 25-\mathrm{H} 25 \cdots \mathrm{Cg2}^{\mathrm{iv}}}$ | 0.93 | 2.99 | $3.6416(17)$ | 129 |
| C $^{2}$ | 0.93 | 2.89 | $3.743(2)$ | 154 |

Symmetry codes: (i) $x+\frac{1}{2},-y+\frac{3}{2},-z+1$; (ii) $\quad-x+\frac{1}{2}, y-\frac{1}{2}, z$; (iii) $x-\frac{1}{2},-y+\frac{3}{2},-z+1$; (iv) $-x+1, y+\frac{1}{2},-z+\frac{3}{2}$.
structure results from the combination of the $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-$ $\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, in the form of a ribbon containing alternating $R_{2}^{2}(7)$ and $R_{4}^{4}$ (22) rings (Fig. 7). The combination of these two chains along [100] and [010] generates a sheet lying parallel to (001) in the domain $\frac{1}{4}<z<\frac{3}{4}$, and a second such sheet, related to the first by inversion, lies in the domain $\frac{3}{4}<z<\frac{5}{4}$. The $\mathrm{C}-\mathrm{H} \cdots \pi$ (arene) interactions both lie within the sheet.

## 4. Database survey

The structures of a number of 2-aryl- N -aryl acetamides related to compounds (I) and (II) have been reported recently. We note in particular the structure of 2-(4-chlorophenyl)-N-(2,6dimethylphenyl)acetamide (III) (Narayana et al., 2016), where the molecules are linked by a combination of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds to form a $C(4) C(4)\left[R_{2}^{1}(7)\right]$ chain of rings very much like that in compound (I), except that the molecules comprising the chain in (III) are related by translation along [100], whereas those in (I) are related by a $c$-glide plane. Other recently reported structures include those of N -(4-bromophenyl)-2-(4-chlorophenyl)acetamide (IV) (Fun, Shahani et al., 2012), 2-(4-bromophenyl)- $N$-(pyrazin-2-yl)acetamide (V) (Nayak et al., 2013) and 2-(4-chlorophenyl)-N-(2,6dimethylphenyl)acetamide (VI) (Fun, Quah et al., 2012), which are related to compounds (I)-(III), respectively. In addition, the structures of some compounds related to (I), but carrying more than one substituent in the $N$-aryl ring have been reported (Praveen et al., 2013a,b; Nayak et al., 2014).

## 5. Synthesis and crystallization

For the synthesis of compounds (I) and (II), equimolar quantities ( 1.0 mmol of each component) of (4-chlorophenyl)acetic acid and either 2-iodoaniline for (I), or 2-aminopyrazine for (II), were dissolved in dichloromethane ( 20 ml ) in the presence of 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride $(0.01 \mathrm{~mol})$ and triethylamine $(0.02 \mathrm{~mol})$ at 273 K . The mixtures were stirred at 273 K for 3 h , and then poured with stirring into an excess of aqueous hydrochloric acid ( $4 \mathrm{~mol} \mathrm{dm}^{-3}$ ). The aqueous mixtures were exhaustively extracted with dichloromethane and in each case, the combined organic extracts were washed first with saturated aqueous sodium hydrogencarbonate solution and then with

Figure 7
Part of the crystal structure of compound (II) showing the formation of a hydrogen-bonded ribbon of $R_{2}^{2}(7)$ and $R_{4}^{4}(22)$ rings running parallel to the [100] direction and built from $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, shown as dashed lines. For the sake of clarity, the C -bound H atoms which are not involved in the motifs shown have been omitted.
brine. The solutions were dried with anhydrous sodium sulfate and then the solvent was removed under reduced pressure, to give the products. Compound (I): yield $78 \%$, m. p. 441-443 K; analysis found $\mathrm{C} 45.4, \mathrm{H} 2.9, \mathrm{~N} 3.9 \%, \mathrm{C}_{14} \mathrm{H}_{11} \mathrm{ClINO}$ requires C 45.2, H 3.0, N 3.8\%. Compound (II): yield $85 \%$, m. p. 421423 K ; analysis found C 58.3, H $4.2, \mathrm{~N} 16.9 \%, \mathrm{C}_{12} \mathrm{H}_{10} \mathrm{ClN}_{3} \mathrm{O}$ requires C 58.2, H 4.1, N 17.0\%. Crystals suitable for singlecrystal X-ray diffraction analysis were grown by slow evaporation, at ambient temperature and in the presence of air, of solutions in dichloromethane.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. All H atoms were located in

Computer programs: APEX2 and SAINT-Plus (Bruker, 2012), SHELXS97 (Sheldrick, 2008), SHELXL2014 (Sheldrick, 2015) and PLATON (Spek, 2009).
difference Fourier maps. The C-bound H atoms were then treated as riding atoms in geometrically idealized positions with $\mathrm{C}-\mathrm{H}$ distances $0.93 \AA$ (aromatic and hetero-aromatic) or $0.97 \AA\left(\mathrm{CH}_{2}\right)$ and with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. For the H atoms bonded to N atoms in compound (II), the atomic coordinates were refined with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{N})$ giving the $\mathrm{N}-\mathrm{H}$ distance shown in Table 2; an attempt to refine similarly the corresponding H -atom coordinates in compound (I) led to an unsatisfactorily low value, 0.74 (3) $\AA$ for the $\mathrm{N}-\mathrm{H}$ distance, possibly associated with the presence of the strongly scattering iodene atom: accordingly this distance was thereafter fixed at $0.86 \AA$. A small number of low-angle reflections, which had been attenuated by the beam stop [(100) and (200) for (I); (002) for (II)] were omitted from the final cycles of refinement. In the final analysis of variance for compound (I), there was a large value, 4.245 , of $\mathrm{K}=\left[\operatorname{mean}\left(F_{\mathrm{o}}{ }^{2}\right) / \operatorname{mean}\left(F_{\mathrm{c}}^{2}\right)\right]$ for the group of 428 very weak reflections having $F_{\mathrm{c}} / F_{\mathrm{c}}$ (max) in the range $0.000<F_{\mathrm{c}} / F_{\mathrm{c}}($ max $)<0.008$.

## Computing details

For both compounds, data collection: APEX2 (Bruker, 2012); cell refinement: APEX2 (Bruker, 2012); data reduction: SAINT-Plus (Bruker, 2012); program(s) used to solve structure: SHELXS97 (Sheldrick, 2008); program(s) used to refine structure: SHELXL2014 (Sheldrick, 2015); molecular graphics: PLATON (Spek, 2009); software used to prepare material for publication: SHELXL2014 (Sheldrick, 2015) and PLATON (Spek, 2009).
(I) 2-(4-Chlorophenyl)- N -(2-iodophenyl)acetamide

## Crystal data

$\mathrm{C}_{14} \mathrm{H}_{11} \mathrm{ClINO}$
$M_{r}=371.59$
Monoclinic, $P 2_{1} / c$
$a=24.001$ (1) Å
$b=6.2369$ (3) $\AA$
$c=9.3266(4) \AA$
$\beta=99.621$ (2) ${ }^{\circ}$
$V=1376.48(11) \AA^{3}$
$Z=4$

## Data collection

Bruker APEXII area detector diffractometer
Radiation source: fine-focus sealed tube
Graphite monochromator
$\varphi$ and $\omega$ scans
Absorption correction: multi-scan
(SADABS; Sheldrick, 2003)
$T_{\text {min }}=0.528, T_{\text {max }}=0.740$
$F(000)=720$
$D_{\mathrm{x}}=1.793 \mathrm{Mg} \mathrm{m}^{-3}$
Mo $K \alpha$ radiation, $\lambda=0.71073 \AA$
Cell parameters from 5030 reflections
$\theta=0.9-33.5^{\circ}$
$\mu=2.51 \mathrm{~mm}^{-1}$
$T=295 \mathrm{~K}$
Block, colourless
$0.30 \times 0.18 \times 0.12 \mathrm{~mm}$

15082 measured reflections
3960 independent reflections
3183 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.026$
$\theta_{\text {max }}=30.0^{\circ}, \theta_{\text {min }}=2.6^{\circ}$
$h=-33 \rightarrow 33$
$k=-8 \rightarrow 8$
$l=-13 \rightarrow 9$

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.037$
$w R\left(F^{2}\right)=0.074$
$S=1.07$
3960 reflections
163 parameters
0 restraints

> Hydrogen site location: inferred from $\quad$ neighbouring sites
> H -atom parameters constrained
> $w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0189 P)^{2}+1.9949 P\right]$
> $\quad$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
> $(\Delta / \sigma)_{\max }=0.001$
> $\Delta \rho_{\max }=1.49 \mathrm{e} \AA^{-3}$
> $\Delta \rho_{\min }=-0.60 \mathrm{e}^{-3}$

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.047$
$w R\left(F^{2}\right)=0.136$
$S=1.02$
3380 reflections
157 parameters
0 restraints

Hydrogen site location: mixed
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0547 P)^{2}+0.9776 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.47 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.51 \mathrm{e} \AA^{-3}$

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\hat{A}^{2}$ )
