In the title compounds, $C_{14}H_{17}N_5OS$ (I) and $C_{13}H_{15}N_5O_2S$ (II), the dihedral angle between the pyrimidine and benzene rings is $58.64(8)^\circ$ in (I) and $78.33(9)^\circ$ in (II). In both compounds, there is an intramolecular C—H···O hydrogen bond, and in (II) there is also an intramolecular N—H···N hydrogen bond present. In the crystals of both compounds, a pair of N—H···N hydrogen bonds links the individual molecules to form inversion dimers with $R_2^2(8)$ ring motifs. In (I), the dimers are linked by N—H···O and C—H···O hydrogen bonds, enclosing $R_2^2(14)$, $R_2^2(11)$ and $R_2^1(7)$ ring motifs, forming layers parallel to the (100) plane. There is also an N—H···π interaction present within the layer. In (II), the inversion dimers are linked by N—H···O hydrogen bonds enclosing an $R_4^4(18)$ ring motif. The presence of N—H···O and C—H···O hydrogen bonds generate an $R_2^1(6)$ ring motif. The combination of these various hydrogen bonds results in the formation of layers parallel to the (111) plane.

1. Chemical context

Diaminopyrimidine derivatives have been proved to be an important class of compounds because of their therapeutic and pharmacological properties. One such important property is its inhibition potency against cancer targets. As a result of the limited capacity of drugs that can cure or at least prolong the survival of cancer patients, there is always an strong requirement for new chemotherapeutics. It has been reported that diaminopyrimidines show inhibition against cyclin-dependent kinases (cdks), thus arresting cell proliferation in cancer cells (Mesguiche *et al.*, 2003). 2,4-Diaminopyrimidine derivatives have also shown effective suppression of anaplastic lymphoma kinase (ALK), one of the receptor tyrosine kinases that is involved in a variety of tumours (Achary *et al.*, 2017). 2,4-Diaminopyrimidine derivatives have also been reported to exhibit potent inhibitory activity against influenza viruses (Kimura *et al.*, 2006) and have anti-retroviral activity (Hocková *et al.*, 2004), anti-bacterial (Kandeel *et al.*, 1994) and potential anti-microbial properties (Holla *et al.*, 2006). Several diaminopyrimidine derivatives have shown good activity, efficiency against the malarial parasite *Plasmodium falciparum* K1 strain (Phuangsawai *et al.*, 2016; Chiang *et al.*, 2009). Interestingly, they also act as calcium channel blocking agents (Manjula *et al.*, 2004; Singh *et al.*, 2009). As part of our own studies in this area, we report herein on the syntheses and

crystal structure analyses of the title compounds, 2-[(4,6-diaminopyrimidin-2-yl)sulfanyl]-*N*-(2,4-dimethylphenyl)acetamide (**I**) and [2-((4,6-diaminopyrimidin-2-yl)sulfanyl)-*N*-(3-methoxyphenyl)acetamide (**II**).

2. Structural commentary

The molecular structures of compounds (**I**) and (**II**) are shown in Figs. 1 and 2, respectively. Compound (**I**) crystallizes in the monoclinic space group $P2_1/c$ and compound (**II**) in the triclinic space group $P\bar{1}$. In compounds (**I**) and (**II**), the diaminopyrimidine and benzene rings are inclined to one another by 58.64 (8) and 78.33 (9)°, respectively. The torsion angle $C4-S1-C5-C6 = 98.12 (11)$ ° in compound (**I**) and $-80.14 (14)$ ° in compound (**II**), torsion angles $S1-C5-C6-N5 = -101.92 (14)$ ° in compound (**I**) and $82.23 (16)$ ° in compound (**II**), and $C5-C6-N5-C7 = 178.66 (15)$ ° in compound (**I**) and $-172.71 (14)$ ° in compound (**II**). The bond lengths $C4-S1 = 1.7650 (14)$ Å and $C5-S1 = 1.8053 (16)$ Å in compound (**I**), and $C4-S1 = 1.7721 (17)$ Å and $C5-S1 = 1.8126 (18)$ Å in compound (**II**), are comparable with the

values reported for a similar structure, 2-[(4,6-diaminopyrimidin-2-yl)sulfanyl]-*N*-(2-methylphenyl)acetamide, *viz.* 1.763 and 1.805 Å, respectively (Subasri *et al.*, 2014). In compound (**I**), atoms C13 and C14 deviate from the benzene ring by 0.010 (3) and 0.012 (3) Å, respectively. Atoms N1 and N2 deviate from the mean plane of the pyrimidine ring by $-0.0819 (18)$ and $0.0636 (14)$ Å, respectively, in compound (**I**), and by $0.0360 (3)$ and $0.0273 (3)$ Å, respectively, in compound (**II**). In both compounds, an intramolecular hydrogen bond, $C8-H8 \cdots O1$, forms an $S(6)$ ring motif, and in compound (**II**) there is also an intramolecular $N-H \cdots N$ hydrogen bond present that forms an $S(7)$ ring motif (see Tables 1 and 2).

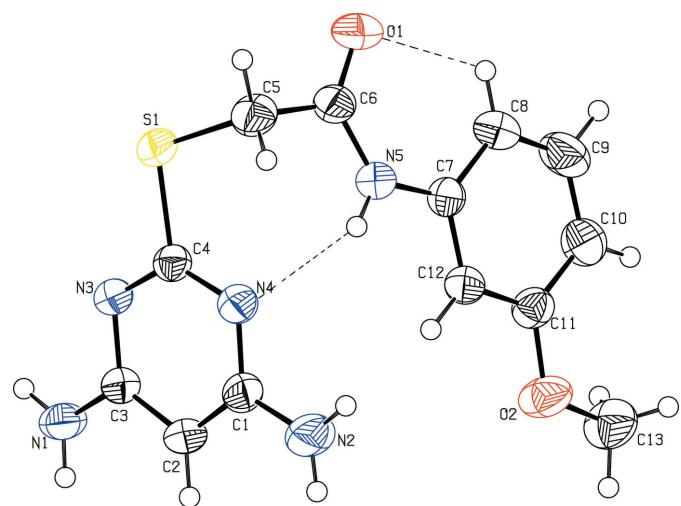

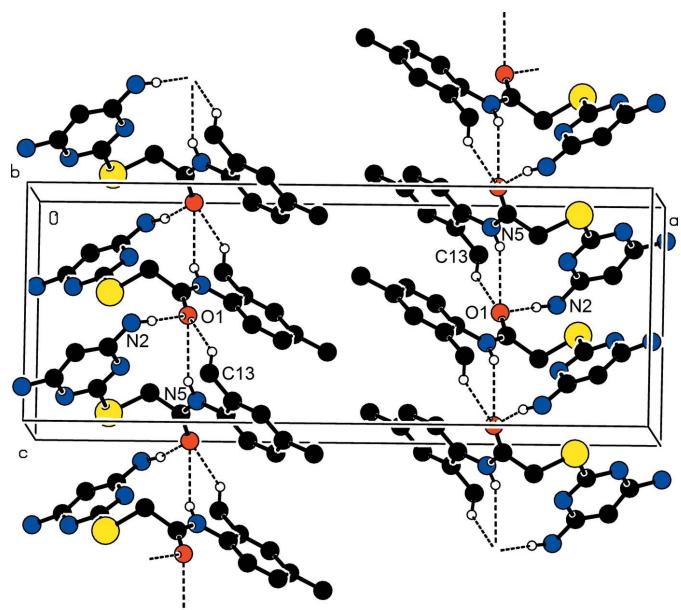

Figure 2

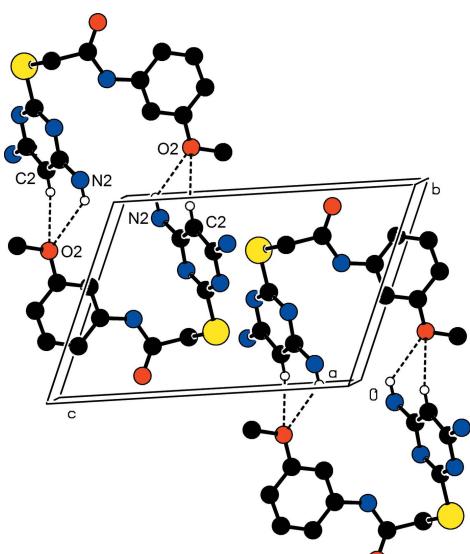

The molecular structure of (**II**), showing the atom labelling and displacement ellipsoids drawn at 50% probability level. The $N-H \cdots N$ and $C-H \cdots O$ contacts are shown as dashed lines (see Table 2).

**Figure 3**

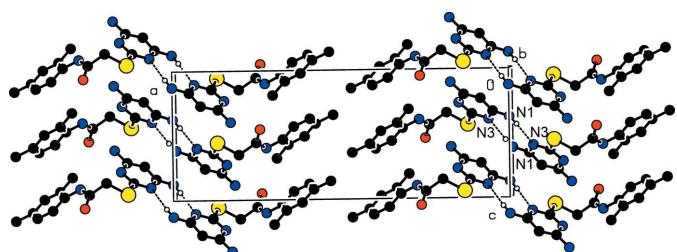

The crystal packing of (I), viewed along the b axis, $\text{C}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds generate $R_2^1(14)$, $R_2^1(11)$ and $R_2^1(7)$ ring motifs. In this and subsequent figures, the hydrogen bonds are shown as dashed lines and H atoms not involved in hydrogen bonding have been omitted for clarity.

3. Supramolecular features

The hydrogen-bonding geometry of compounds (I) and (II) are given in Tables 1 and 2, respectively. In compound (I), atom O1 is a triple acceptor of hydrogen bonds. The $\text{N}5-\text{H}5\cdots\text{O}1^{ii}$ hydrogen bonds form a chain running along the c -axis direction. The $\text{N}2-\text{H}2\text{A}\cdots\text{O}1^{ii}$ and $\text{C}13-\text{H}13\text{C}\cdots\text{O}1^{ii}$ hydrogen bonds generate an $R_2^1(14)$ ring motif, and the $\text{N}2-\text{H}2\text{A}\cdots\text{O}1^{ii}$ and $\text{N}5-\text{H}5\cdots\text{O}1^{ii}$ hydrogen bonds form an $R_2^1(11)$ ring motif, and $\text{N}5-\text{H}5\cdots\text{O}1^{ii}$ and $\text{C}13-\text{H}13\cdots\text{O}1^{ii}$

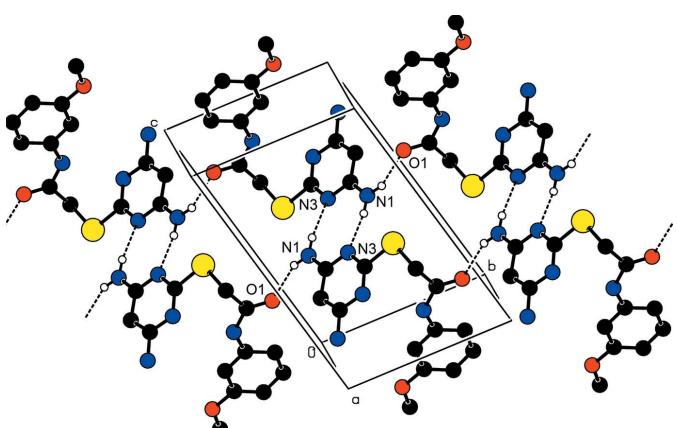

**Figure 4**

A partial view of the crystal packing of (I), viewed approximately along the c axis, showing the $\text{N}-\text{H}\cdots\pi$ interactions.

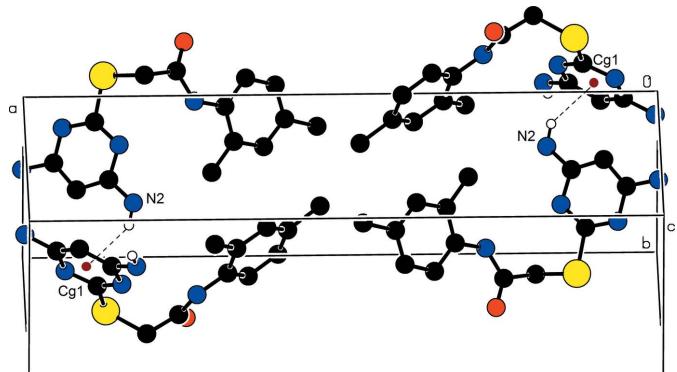

**Figure 5**

A view along the b axis of the crystal packing of (I), showing the $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds that generate an $R_2^2(8)$ ring motif.

hydrogen bonds generate an $R_2^1(7)$ ring motif (Table 1 and Fig. 3). There is also a $\text{N}2-\text{H}2\text{B}\cdots\pi$ interaction present within the layer (Table 1 and Fig. 4), with the separation distance between the donor and acceptor, $\text{Cg}1$, being $3.4851(1)$ Å. The $\text{N}1-\text{H}1\text{A}\cdots\text{N}3^i$ hydrogen bond generates an inversion dimer with an $R_2^2(8)$ ring motif (Table 1 and Fig. 5). As a result of the hydrogen bonding, layers parallel to the bc plane are formed.

**Figure 6**

The crystal packing of (II), viewed along the a axis, $\text{C}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds generate two $R_2^2(26)$ ring motifs and one $R_2^1(6)$ ring motif.

**Figure 7**

A partial view along the a axis of the crystal packing of (II). The $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds generate an $R_2^2(8)$ ring motif and $\text{N}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds an $R_4^4(18)$ ring motif.

Computer programs: APEX2 and SAINT (Bruker, 2008), SHELXS97 (Sheldrick, 2008), SHELXL2016 (Sheldrick, 2015), ORTEP-3 for Windows (Farrugia, 2012) and PLATON (Spek, 2009).

In compound (II), atom O2 is a double acceptor of hydrogen bonds. The N2—H2B···O2ⁱⁱⁱ hydrogen bond forms an R₂²(26) ring motif and hydrogen bond C2—H2···O2ⁱⁱⁱ generates an R₂²(26) ring motif (Table 2 and Fig. 6). These two intermolecular hydrogen bonds generate an R₂¹(6) ring motif, which is shown in Fig. 6. Molecules are linked by a pair of N1—H1A···N3ⁱ hydrogen bonds, forming an inversion dimer with an R₂²(8) ring motif, and hydrogen bonds N1—H1B···O1ⁱⁱ and N1—H1A···N3ⁱ generate an R₄⁴(18) ring motif (Table 2 and Fig. 7). The combination of these various hydrogen bonds results in the formation of layers parallel to (1 $\overline{1}$ 1).

4. Database survey

A search of the Cambridge Structure Database (Version 5.37, update May 2016; Groom *et al.*, 2016) for 2-[(pyrimidine-2-yl)sulfanyl]-N-phenylacetamide yielded seven hits. Three of these involve (4,6-diaminopyrimidin-2-yl) groups. They include the 2-methylphenyl analogue, 2-[(4,6-diaminopyrimidin-2-yl)sulfanyl]-N-(2-methylphenyl)acetamide (GOKWIO; Subasri *et al.*, 2014), the 2-chlorophenyl analogue, N-(2-chlorophenyl)-2-[(4,6-diaminopyrimidin-2-yl)sulfanyl]-acetamide (ARARUI; Subasri *et al.*, 2016) and the 3-nitrophenyl analogue, 2-[(4,6-diaminopyrimidin-2-yl)sulfanyl]-N-(3-nitrophenyl)acetamide (ARAROC; Subasri *et al.*, 2016). Here the pyrimidine and benzene rings are inclined to one

another by 54.73, 67.11 and 56.19°, respectively, compared to 58.64 (8) ° in compound (I), and 78.33 (9) ° in compound (II).

5. Synthesis and crystallization

Compound (I): To a solution of 4,6-diamino-pyrimidine-2-thiol (0.5 g, 3.52 mmol) in 25 ml of ethanol in a round-bottom flask, potassium hydroxide (0.2 g, 3.52 mmol) was added and the mixture was refluxed for 30 min. 2,4-Dimethylphenyl acetamide (3.52 mmol) was added and the mixture was refluxed for 3 h. At the end of the reaction (observed by TLC), the ethanol was evaporated under vacuum and cold water was added. The precipitate formed was filtered and dried to give compound (I) as a crystalline powder (yield 67%). After purification, the compound was recrystallized from ethanol solution by slow evaporation of the solvent.

Compound (II): To a solution of 4,6-diamino-pyrimidine-2-thiol (0.5 g, 3.52 mmol) in 25 ml of ethanol in a round-bottom flask was added potassium hydroxide (0.2 g, 3.52 mmol) and the mixture was refluxed for 30 min. 3-Methoxyphenyl acetamide (3.52 mmol) was added and the mixture was refluxed for 3 h. At the end of the reaction (observed by TLC), the ethanol was evaporated under vacuum and cold water was added, and the precipitate formed was filtered and dried to give compound (II) as a shiny powder (yield 73%). After purification, the compound was recrystallized from ethanol solution by slow evaporation of the solvent.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. For both compounds the hydrogen atoms were placed in calculated positions and refined using the riding model: C—H = 0.93–0.97 Å and N—H = 0.86 Å, with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C-methyl})$ and $1.2U_{\text{eq}}(\text{N,C})$ for other H atoms.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Crystal data

$\text{C}_{13}\text{H}_{15}\text{N}_5\text{O}_2\text{S}$	$Z = 2$
$M_r = 305.36$	$F(000) = 320$
Triclinic, $P\bar{1}$	$D_x = 1.388 \text{ Mg m}^{-3}$
$a = 8.014 (5) \text{ \AA}$	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
$b = 8.724 (5) \text{ \AA}$	Cell parameters from 2991 reflections
$c = 12.068 (5) \text{ \AA}$	$\theta = 1.8\text{--}26.5^\circ$
$\alpha = 106.561 (5)^\circ$	$\mu = 0.23 \text{ mm}^{-1}$
$\beta = 97.888 (5)^\circ$	$T = 293 \text{ K}$
$\gamma = 110.461 (5)^\circ$	Block, yellow
$V = 730.9 (7) \text{ \AA}^3$	$0.30 \times 0.25 \times 0.20 \text{ mm}$

Data collection

Bruker SMART APEXII area-detector diffractometer	2991 independent reflections
ω and φ scans	2616 reflections with $I > 2\sigma(I)$
Absorption correction: multi-scan (<i>SADABS</i> ; Bruker, 2008)	$R_{\text{int}} = 0.026$
$T_{\min} = 0.785$, $T_{\max} = 0.843$	$\theta_{\max} = 26.5^\circ$, $\theta_{\min} = 1.8^\circ$
10789 measured reflections	$h = -10 \rightarrow 9$
	$k = -10 \rightarrow 10$
	$l = -15 \rightarrow 15$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.110$	$w = 1/[\sigma^2(F_o^2) + (0.082P)^2 + 0.3261P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.81$	$(\Delta/\sigma)_{\max} = 0.001$
2991 reflections	$\Delta\rho_{\max} = 0.17 \text{ e \AA}^{-3}$
191 parameters	$\Delta\rho_{\min} = -0.27 \text{ e \AA}^{-3}$
0 restraints	
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
