The title compound, $C_{20}H_{22}N_2O_2$, an alkaloid isolated from the Madagascar periwinkle, crystallizes in $P1$ with two independent but closely similar molecules in the unit cell. The molecules are linked into pairs by two $N-H\cdots O=C$ hydrogen bonds. The absolute configuration was confirmed by anomalous dispersion effects as *S* at the 3 and 15 positions, and *R* at the 7 position.

1. Chemical context

The Madagascar periwinkle or rosy periwinkle (*Catharanthus roseus* L. G. Don), a member of the family Apocynaceae, is one of the most intensively studied medicinal plants (Sotomayor *et al.*, 1998; Sreevalli *et al.*, 2004). Aerial parts of the plant contain between 0.2 and 1% of a mixture of more than 120 alkaloids (van Der Heijden *et al.*, 2004). The most abundant are the monomers such as catharanthine and vindoline (Renault *et al.*, 1999). The dimeric alkaloids that result from the joining of two compounds can display interesting pharmaceutical activities. Thus vinblastine and vincristine are used in the chemotherapy of leukemia and in the treatment of Hodgkin's disease (Verma *et al.*, 2007). Additionally, ajmalicine, a monomeric indole alkaloid present in the root of *C. roseus*, is an antihypertensive alkaloid (Noble, 1990). In view of their medical and commercial value, the appropriate methods of extraction and purification have been well studied.

We have undertaken the X-ray crystal structure determination of the title compound in order to establish its absolute stereochemistry. One-dimensional (1H , ^{13}C , DEPT135) and two-dimensional NMR (HSQC, HMBC, $^1H/^1H$ -COSY, $^1H/^1H$ -NOESY) experiments clearly assigned the proton and carbon resonances and are consistent with the constitution of

Table 1
Hydrogen-bond geometry (\AA , $^\circ$).

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
$\text{N}1-\text{H}01\cdots \text{O}1$	0.90 (4)	2.20 (3)	2.754 (3)	119 (3)
$\text{N}1-\text{H}01\cdots \text{O}1'$	0.90 (4)	2.23 (4)	3.018 (3)	146 (3)
$\text{N}1'-\text{H}01'\cdots \text{O}1'$	0.89 (4)	2.20 (4)	2.745 (4)	119 (3)
$\text{N}1'-\text{H}01'\cdots \text{O}1$	0.89 (4)	2.31 (4)	3.098 (3)	147 (4)
$\text{C}18-\text{H}18A\cdots \text{O}2$	0.98	2.64	3.609 (4)	168
$\text{C}18'-\text{H}18D\cdots \text{O}2'$	0.98	2.50	3.469 (4)	173

akuammicine (Buckingham *et al.*, 2010). As the final purification step was performed with an alkaline solvent mixture, the NMR data of akuammicine correspond to the free base, and can be linked to the determined stereochemistry.

2. Structural commentary

The title compound crystallizes in space group $P1$ with two independent molecules (Fig. 1). The two molecules are closely similar; a least-squares fit of all non-H atoms gives an r.m.s. deviation of 0.065 \AA , whereby the largest deviation is 0.29 \AA for the methyl carbon C18. The absolute configuration is established as *S* at C3 and C15 and *R* at C7. Intramolecular classical $\text{N}1-\text{H}01\cdots \text{O}1$ hydrogen bonds are observed (Table 1). The $\text{C}18-\text{H}18A\cdots \text{O}2$ contacts in both molecules may represent a significant intramolecular interaction.

The five-membered ring involving N4 displays an envelope conformation, with C5 lying outside the plane of the other four atoms. The cyclohexene ring is a ‘skew-boat’ or 1,3-diplanar form, with torsion angles of approximately zero about C3–C7 and C2=C16. Finally, the six-membered ring involving N4 shows a form intermediate between boat and skew-boat; the torsion angle about C15–C20 is approximately zero, but that about C3–N4 (which would also be zero for an ideal boat) is about 24° . See Table 2 for details.

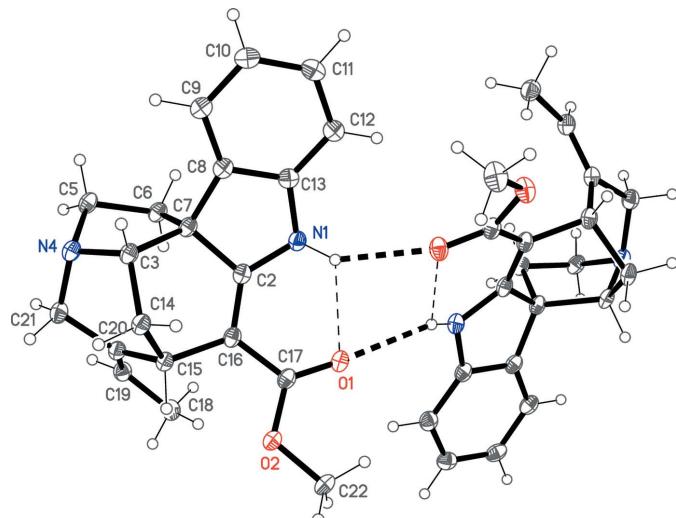

Figure 1

The structure of the title compound in the crystal. Ellipsoids represent 30% probability levels. Both independent molecules are shown, but for clarity only one is labelled. The second molecule has the same numbering but with primes. Dashed lines represent hydrogen bonds.

Selected torsion angles ($^\circ$).

$\text{C}14-\text{C}3-\text{N}4-\text{C}21$	-24.3 (3)	$\text{C}14'-\text{C}3'-\text{N}4'-\text{C}21'$	-24.0 (3)
$\text{C}14-\text{C}3-\text{C}7-\text{C}2$	-0.2 (4)	$\text{C}14'-\text{C}3'-\text{C}7'-\text{C}2'$	-0.1 (3)
$\text{C}7-\text{C}2-\text{C}16-\text{C}15$	-7.1 (4)	$\text{C}7'-\text{C}2'-\text{C}16'-\text{C}15'$	-9.0 (4)
$\text{C}14-\text{C}15-\text{C}20-\text{C}21$	-3.6 (3)	$\text{C}14'-\text{C}15'-\text{C}20'-\text{C}21'$	-1.6 (4)

3. Supramolecular features

The two molecules are connected by the two classical hydrogen bonds, $\text{N}1-\text{H}01\cdots \text{O}1'$ and $\text{N}1'-\text{H}01'\cdots \text{O}1$ (Fig. 1, Table 1), to form a dimeric assembly. The contacts $\text{C}11-\text{H}11\cdots \text{Cg}1(1+x, -1+y, z)$ and $\text{C}11'-\text{H}11'\cdots \text{Cg}2(-1+x, 1+y, z)$, where $\text{Cg}1$ is the mid-point of $\text{C}19=\text{C}20$ and $\text{Cg}2$ is the mid-point of $\text{C}19'=\text{C}20'$, may represent $\text{C}-\text{H}\cdots \pi$ interactions; the $\text{H}\cdots \text{Cg}$ distances are 2.74 and 2.72 \AA , and the angles at H are 147 and 155° , respectively.

4. Database survey

The most similar natural product to have been investigated by X-ray structure analysis is probably isovoacangine (Soriano-García *et al.*, 1991), refcode KORZOG.

5. Isolation and crystallization

The title compound was isolated using a combination of high-performance countercurrent chromatography (HPCCC) (Ito, 2005), preparative C18 high-performance liquid chromatography (HPLC) and silica-gel column chromatography (Ito, 2005). Seedlings of F1 Titan Rose *Catharanthus roseus*, purchased from a commercial provider of pharmaceutical plants (Gärtnerei Volk GmbH Pflanzenhandel, Braunschweig, Germany), were planted and grown outside from June to July 2015 on a mixture of standard garden soil and sand (2:1). Aerial plant parts were harvested and lyophilized, and dried tissue material was then milled by a bead mill [Mixer Mill MM 200 (RETSCH, Haan, Germany) at a vibrational frequency of 25 Hz for 1 min]. The dried powder was immersed in water adjusted to pH 2 by trifluoroacetic acid (TFA), homogenized by a T-25 digital ULTRA-TURRAX (IKA, Staufen, Germany) at maximum speed (25 000 rpm for 10 min) and shaken overnight for extraction. Plant particles were centrifuged off (30 min, 8000 rpm). The acidic extract was lyophilized and redissolved in 1 l chloroform. A solution of NaOH was added (1 l, 200 mM) and the solutions were vigorously mixed for alkaloid extraction. The phases were centrifuged (8000 rpm, 15 min) and the chloroform phase was dried for indole-alkaloid recovery.

The complex indole-alkaloid crude extract (700 mg) was injected into a semi-preparative HPCCC instrument (Spectrum, Dynamic Extractions Ltd, Gwent, UK) (Ito, 2005), a J-type centrifuge equipped with two coil bobbins (PTFE tubing, ID 1.6 mm, column volume 125 ml) operated with the biphasic solvent system water/n-hexane/n-butanol (2:1 v/v/v) using the ion-pair reagent TFA (5.0 ml l⁻¹). The rota-

tion velocity was set to 1600 rpm (240 g field), and the flow rate of the aqueous mobile phase (5.0 ml min^{-1}) (head-to-tail mode) resulted in a stationary phase retention of 60% after system equilibration.

For metabolite profiling, aliquots of the recovered HPCCC fractions were injected in sequence into an ESI-ion trap MS/MS (HCT Ultra ETD II, Bruker Daltonics, Bremen, Germany) in a standard protocol described by Jerz *et al.* (2014) and the target alkaloid akuammicine was detected with $[M+\text{H}]^+$ at m/z 323 in fractions 61 to 69 (elution volume 304–345 ml). The combined fractions were re-chromatographed by preparative HPLC (Wellchrom K-1001, Knauer Gerätebau Berlin, Germany) using a C18 column (Prontosil C18Aq, 25 × 250 mm) and an isocratic flow rate of 4.5 ml min^{-1} (acetone:nitrile:water, 60:40 with 1% TFA). Alkaloids were monitored using a UV detector (Wellchrom K-2600, Knauer Gerätebau, Berlin, Germany) at λ 254, 280 and 300 nm.

The 10 mg amber-coloured HPLC fraction was finally purified by SiO_2 column chromatography (Merck, Darmstadt, Germany) using ethyl acetate/*n*-hexane/ethanol/25% aqueous ammonia (100/5/5/3) to yield pure akuammicine (1.2 mg), detected by thin-layer chromatography (TLC) (SiO_2 60 F254, Merck, Darmstadt, Germany) with this solvent system and sprayed with Dragendorff reagent (R_F value 0.25). LC-ESI-MS, measured in the positive ionization mode using a Prontosil C18-Aq column (250 × 2.0 mm, 5 μm , 100 \AA , Knauer Gerätebau, Berlin, Germany), detected akuammicine, ESI-MS/MS (pos) $[M+\text{H}]^+$: m/z 323, MS/MS 291 (100%).

Akuammicine crystals grew in tube fractions during slow evaporation of the solvents, and an appropriate colourless crystal was chosen for X-ray analysis.

^1H NMR (FT 300, Bruker Biospin, Rheinstetten, Germany, 300 MHz, CDCl_3), calibrated to tetramethylsilane (TMS), δ (p.p.m.): 8.97 (1H, s, NH-1), 7.39 (1H, d, $J = 7.5 \text{ Hz}$, H-9), 7.24 (1H, dt, $J_1 = 8.0$ and $J_2 = 0.8 \text{ Hz}$, H-11), 6.98 (1H, t, $J_1 = 7.5$ and $J_2 = <1 \text{ Hz}$, H-10), 6.87 (1H, d, $J = 7.5 \text{ Hz}$, H-12), 5.72 (1H, q, $J = 7.0 \text{ Hz}$, H-19), 4.71 (1H, sbr, H-3), 4.37 (1H, d, $J = 15.0 \text{ Hz}$, H_a-21), 4.11 (1H, sbr, H-15), 4.02 (1H, m, H_a-5), 3.84 (3H, s, CH₃-22), 3.37 (1H, d, $J = 15.0 \text{ Hz}$, H_b-21), 3.31 (1H, dd, $J_1 = 12.0$ and $J_2 = 6.5 \text{ Hz}$, H_b-5), 2.68 (1H, dt, $J_1 = 13.5$ and $J_2 = 6.7 \text{ Hz}$, H_a-6), 2.59 (1H, J₁ = 15.0 and J₂ = 3.0 Hz, H_b-14), 2.19 (1H, dd, $J_1 = 13.0$ and $J_2 = 6.0 \text{ Hz}$, H_b-6), 1.71 (3H, d, $J = 7.0 \text{ Hz}$, CH₃-18), 1.51 (1H, dt, J₁ = 15.0 and J₂ = 3.0 Hz, H_a-14).

^{13}C NMR (75 MHz, CDCl_3), calibrated with solvent signal at δ 77.26 p.p.m., δ (p.p.m.): 167.2 (C-17), 164.0 (C-2), 143.1 (C-13), 133.2 (C-8), 130.9 (C-20), 129.8 (C-19), 129.6 (C-11), 122.3 (C-10), 121.4 (C-9), 110.5 (C-12), 102.3 (C-16), 61.5 (C-3), 55.1 (C-21), 55.0 (C-7), 54.1 (C-5), 51.8 (C-22), 43.2 (C-6), 29.3 (C-14), 28.5 (C-15), 13.8 (C-18).

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. N-bound H atoms were refined freely. Methyls were refined as idealized rigid groups, with C—H = 0.98 \AA and H—C—H = 109.5°. Other H atoms were

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
