The title compound, $C_{20}H_{23}FN_2O_4$, is the product of a ring-expansion reaction from a seven-membered fluorinated hexahydroazepine to a nine-membered azonine. The nine-membered azonine ring of the molecule adopts a *chair-boat* conformation. The C=C and C–N bond lengths [1.366 (3) and 1.407 (3) Å, respectively] indicate the presence of conjugation within the enamine $CH_2-C=C-N-CH_2$ fragment. The substituent planes at the C=C double bond of this fragment are twisted by 16.0 (3)° as a result of steric effects. The amine N(Et) N atom has a trigonal-pyramidal configuration (sum of the bond angles = 346.3°). The interplanar angle between the two carboxylate substituents is 60.39 (8)°. In the crystal, molecules form zigzag chains along [010] by intermolecular N–H···O hydrogen-bonding interactions, which are further packed in stacks toward [100]. The title azoninoindole might be considered as a candidate for the design of new Alzheimer drugs.

1. Chemical context

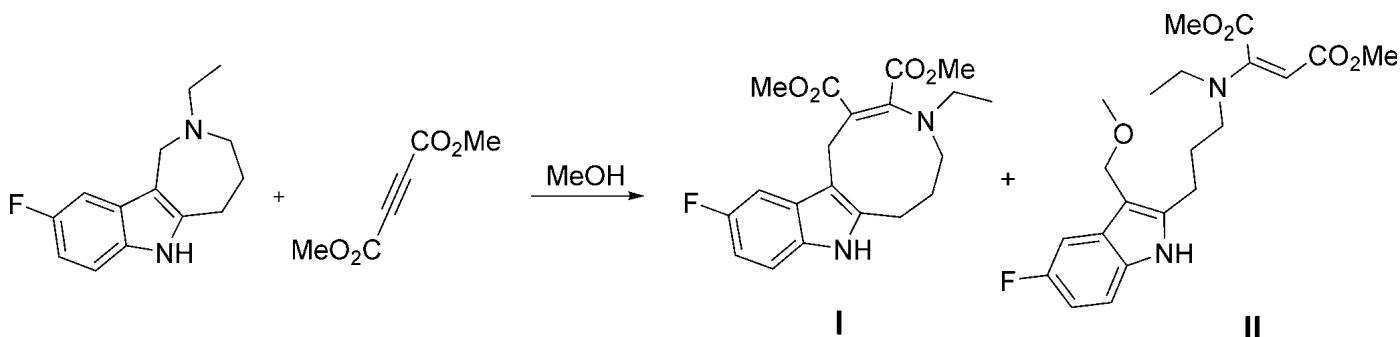

Eight-, nine-, and ten-membered heterocycles, often referred to as medium-sized rings, remain largely unexplored because of the lack of general convenient routes for their synthesis. Meanwhile, such medium-sized heterocycles, in particular azonine, frequently occur in natural products, such as alkaloids (Neuss *et al.*, 1959, 1962; Upadhyay & Bhakuni, 1975), and thus they are considered to be promising fragments in drug design.

Voskressensky and his group have pioneered the tandem transformation of fused tetrahydropyridines into azines bearing an enamine moiety in the eight-membered ring under the action of activated alkynes. Based on this reaction, convenient preparative routes to tetrahydropyrrolo[2,3-*d*]-azocines (Varlamov *et al.*, 2002), tetrahydroazocino[5,4-*b*]-indoles, and tetrahydroazocino[4,5-*b*]indoles (Voskressensky *et al.*, 2004) have been elaborated. The application of a similar approach to hexahydroazepine gives rise to azoninoindoles (Nguyen *et al.*, 2017), which are otherwise hard to obtain.

Azoninoindole **I** was successfully synthesized from the initial 2-ethyl-9-fluoro-1,2,3,4,5,6-hexahydroazepino[4,3-*b*]-indole *via* a domino reaction under the action of dimethyl

OPEN ACCESS

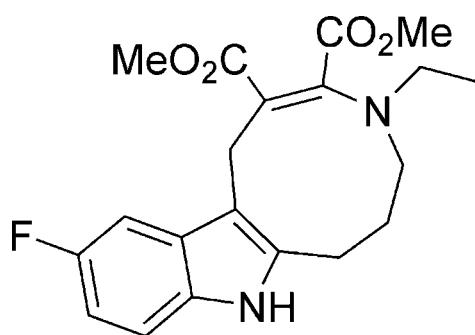

**Figure 1**

The synthesis of dimethyl 4-ethyl-11-fluoro-1,4,5,6,7,8-hexahydroazonino[5,6-b]indole-2,3-dicarboxylate **I** in methanol.

acetylenedicarboxylate in methanol at room temperature (Fig. 1). The domino reaction results in the expansion of the hexahydroazepine ring to the azonine *viz.* dimethyl 4-ethyl-11-fluoro-1,4,5,6,7,8-hexahydroazonino[5,6-b]indole-2,3-dicarboxylate (**I**). 3-Methoxymethyl-substituted indole **II** was isolated as a by-product of this reaction.

The azonine systems, as a result of their specific structure, are known to act as ligands towards different receptors, thus demonstrating diverse types of biological activity (Magnus *et al.*, 1987; Kuehne, Bornman *et al.*, 2003; Kuehne, He *et al.*, 2003; Afsah *et al.*, 2009; Rostom, 2010; Tanaka *et al.*, 2014; Soldi *et al.*, 2015; Hartman & Kuduk, 2016), including anti-Alzheimer's disease activity (Nguyen *et al.*, 2017).

The title compound **I**, $C_{20}H_{23}FN_2O_4$, is the product of a ring expansion reaction from a seven-membered fluorinated hexahydroazepine to a nine-membered azonine. The molecular structure of **I** is unambiguously confirmed by the X-ray diffraction study (Fig. 2).

2. Structural commentary

Compound **I** is isostructural to the non-fluorinated analog published by us very recently (Nguyen *et al.*, 2017). The nine-membered azonine ring of the molecule adopts a *chair-boat* conformation (the basal planes are N4—C5/C1—C12B and C5—C6/C7A—C12B, respectively). It should be noted that the analogous nine-membered azonine ring in the related compound methyl 4-ethyl-11-methyl-1,4,5,6,7,8-hexahydroazonino[5,6-b]indole-2-carboxylate adopts a twisted *boat* conformation (Voskressensky, *et al.*, 2006). The C2=C3 and C3—N4 bond lengths [1.366 (3) and 1.407 (3) Å, respectively] indicate the presence of conjugation within the enamine

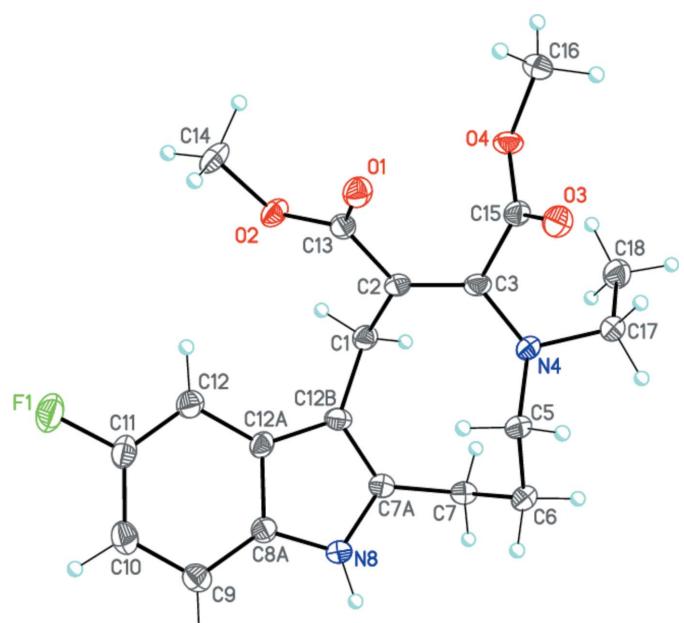

C2=C3—N4 fragment. The substituent planes at the C2=C3 double bond are twisted by 16.0 (3)° because of steric effects. The N4 nitrogen atom has a trigonal-pyramidal configuration (sum of the bond angles is 346.3°). The interplanar angle between the two carboxylate substituents is 60.39 (8)°.

3. Supramolecular features

In the crystal, molecules of **I** form zigzag chains along [010] by intermolecular N—H···O¹ hydrogen-bonding interactions (Table 1, Fig. 3), which are further packed in stacks towards [100].

4. Synthesis and crystallization

Dimethyl acetylenedicarboxylate (170 mg, 1.2 mmol) was added to 2-ethyl-9-fluoro-1,2,3,4,5,6-hexahydroazepino[4,3-b]indole (232 mg, 1 mmol) dissolved in methanol (10 ml). The reaction mixture was stirred for 2 h at room temperature with

**Figure 2**

The molecular structure of **I**. Displacement ellipsoids are drawn at the 50% probability level. H atoms are shown as small spheres of arbitrary radius.

the TLC real-time control. Then the solvent was removed *in vacuo* and the residue was chromatographed over silica with ethylacetate:hexane as eluent to yield the target fluorinated azoninoindole **I** (22%) and 3-methoxymethylindole **II**. Light-yellow crystals of azoninoindole **I** suitable for X-ray crystallographic analysis were grown by slow evaporation of an ethylacetate:hexane (1:1) solution, m.p. 456–458 K.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The X-ray diffraction study was carried out on the "Belok" beamline of the National Research Center "Kurchatov Institute" (Moscow, Russian Federation) using a Rayonix SX165 CCD detector. A total of 360 images were collected using an oscillation range of 1.0° (φ scan mode, two different crystal orientations) and corrected for absorption using the *SCALA* program (Evans, 2006). The data were indexed, integrated and scaled using the utility *iMOSFLM* in the CCP4 program suite (Battye *et al.*, 2011).

The hydrogen atoms of the amino groups were localized in the difference-Fourier map and refined isotropically with fixed displacement parameters [$U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$]. The other hydrogen atoms were placed in calculated positions with C—H = 0.95–0.99 Å and refined in the riding model with fixed isotropic displacement parameters [$U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$].

Funding information

This work was supported by the RUDN Program "5–100". X-ray crystallographic studies using synchrotron radiation were performed at the unique scientific facility Kurchatov Synchrotron Radiation Source supported by the Ministry of Education and Science of the Russian Federation (project code RFMEFI61917X0007).

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
