The title compound, $[\text{RuCl}_2(\text{C}_{33}\text{H}_{43}\text{N}_3\text{O})]$, is an example of a new generation of *N,N*-dialkyl ruthenium catalysts with an N–Ru coordination bond as part of a six-membered chelate ring. The Ru atom has an Addison τ parameter of 0.244, which indicates a geometry intermediate between square-based pyramidal and trigonal-bipyramidal. The complex shows the usual *trans* arrangement of the two chlorides, with Ru–Cl bond lengths of 2.3515 (8) and 2.379 (7) Å, and a Cl–Ru–Cl angle of 158.02 (3)°. One of the chlorine atoms and the atoms of the 2-methoxy-*N*-methyl-*N*-[(2-methylphenyl)methyl]ethane-1-amine group of the title complex display disorder over two positions in a 0.889 (2): 0.111 (2) ratio.

1. Chemical context

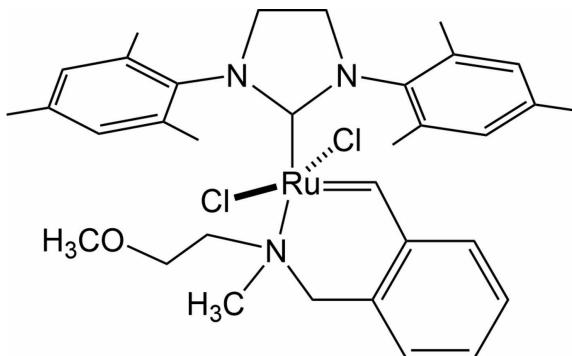

Over the past decades, significant progress has been made in the conceptualization of methodology of organometallic catalytic systems for olefin metathesis (for selected reviews and books on the topic, see: Grela, 2014; Ogbu *et al.*, 2018; Mukherjee *et al.* 2018; Tsedalu, 2021; Copéret *et al.*, 2021). This has made it possible to successfully overcome some of the limitations that initially prevented the integration of ruthenium catalysts in both laboratory practice and industry. The list of such areas includes production of bioactive substances with a desired selectivity of the resulting double bond, obtaining highly functionalized organic compounds, and the synthesis of new materials including polymers (Pederson *et al.*, 2002; Kozłowska *et al.*, 2014; Eivgi *et al.*, 2020). Complexes including a six-membered chelate ruthenium ring are effective catalysts for various types of olefin metathesis reactions (Polyanskii *et al.*, 2019*a,b*; Kumandin *et al.*, 2020, 2023; Antonova *et al.*, 2020; Vasilyev *et al.*, 2023). On the other hand, the catalytic activity of metal complexes is dictated by the ligands, while the coordination environment of the metal center and ligands can be decorated by attaching different non-covalent bond donor or acceptor substituents for the regulation of the structure and the reactivity of the catalysts (Gurbanov *et al.*, 2022*a,b*; Mahmoudi *et al.*, 2017*a,b*; Mahmudov *et al.*, 2013, 2023). This work proposes a method

for obtaining a new chelate complex from the commercially available precursors [RuCl₂(1,3-bis(2,4,6-trimethylphenyl)-imidazoline-2-ylidene)(3-phenyldienylide-1-ene)(pyridine)] and styrene 2-methoxy-N-methyl-N-(2-vinylbenzyl)ethan-1-amine. By X-ray analysis, it was proved that this complex is a *trans*-isomer, relative to the arrangement of the two chlorides.

2. Structural commentary

The Ru atom in the title compound is pentacoordinated to two C, one N and two Cl atoms (Fig. 1, Table 1). The Addison parameter is used to describe the distortion of the coordination geometry and is defined as τ (difference between two largest angles / 60 for five-coordinated metal centers), allowing the distinction between trigonal-bipyramidal (ideally $\tau = 1$) and square-pyramidal (ideally $\tau = 0$) geometries (Addison *et al.*, 1984). For the title complex, $\tau = 0.244$, which is between these two geometries (Fig. 2), [$\tau = 0.09$ for minor disorder Cl2' and the coordination geometry is closer to square pyramidal]. The dihedral angle between the planes of the trimethylphenyl rings is 26.34 (10) $^\circ$. The complex shows the usual *trans* arrangement of the two chlorides, with Ru—Cl bond lengths of 2.3515 (8) and 2.379 (7) Å, and a Cl—Ru—Cl angle of 158.02 (3) $^\circ$. The bond lengths and angles about the Ru atom are in good agreement with those reported for similar compounds (see Database survey section).

3. Supramolecular features

The crystal structure of the title complex includes intra- and intermolecular C—H \cdots Cl interactions (Tables 2 and 3). In the ten intramolecular C—H \cdots Cl interactions, the H \cdots Cl distances vary from 2.56 to 2.94 Å, while the C—H \cdots Cl angles vary from 110 to 129 $^\circ$. The intermolecular C—H \cdots Cl interactions in the title complex are shown in Fig. 3. A weak intramolecular C—H \cdots π interaction is also observed.

4. Database survey

The compounds [1,3-bis(2,4,6-trimethylphenyl)imidazolidin-2-ylidene]-dichloro-[2-[1-(dimethylamino)ethyl]benzylidene]-ruthenium (CSD refcode TITTUO; Polyanskii *et al.*, 2019a), *cis*-dichlorido-(1,3-dimesitylimidazolidin-2-ylidene)(2-formylbenzylidene-*C,O*)ruthenium diethyl ether solvate (DULVOW; Slugovc *et al.*, 2010) and *cis*-(SPY-5-34)-dichloro(4,5-dihydro-1,3-dimesitylimidazol-2-ylidene)(2-formylbenzylidene-*C,O*)-

Table 3
Summary of short interatomic contacts (\AA) in the title compound.

Contact	Distance	Symmetry operation
H14B···H4A	2.46	$\frac{3}{2} - x, \frac{1}{2} + y, \frac{1}{2} - z$
*H34D···*H26	2.17	$\frac{5}{2} - x, -\frac{1}{2} + y, \frac{1}{2} - z$
*H29'···H12C	2.41	$\frac{1}{2} - x, 1 - y, -z$
C9···H19	2.94	$-\frac{1}{2} + x, \frac{1}{2} - y, -\frac{1}{2} + z$
*H28···*H35B	2.32	$-\frac{1}{2} + x, \frac{3}{2} - y, -\frac{1}{2} + z$
*H26'···H23A	2.42	$x, 1 + y, z$
*H33···H22B	2.40	$2 - x, 1 - y, 1 - z$

is an important factor and these interactions form a framework-like structure containing channels that extend along the b and c axes, respectively (Samojłowicz *et al.*, 2009).

5. Synthesis and crystallization

In a Schlenk flask, ruthenium precursor complex [RuCl₂(1,3-bis(2,4,6-trimethylphenyl)imidazoline-2-ylidene)(3-phenylindenylide-1-ene)(pyridine)] (200 mg, 0.26 mmol, 1.0 equiv.) was dissolved in dry toluene (4 mL) under an argon atmosphere. Then the styrene (0.31 mmol, 1.2 equiv.) was added in an argon stream, after that the flask was sealed with a screw cap and heated at 353 K for 1 h. The reaction mixture was placed in a freezer (253 K) for 30 min. The precipitate was filtered off and washed sequentially with hexane (3 × 5 mL) and methanol (3 × 3 mL), both cooled to 253 K, to give the title complex as a green powder after drying under vacuum for 2 h. A single crystal was obtained by slow crystallization from a hexane/chloroform mixture at 298 K.

Green powder, 104 mg, 0.41 mmol, 60%, $R_f = 0.85$ (Sorbfil plates for thin-layer chromatography, EtOAc: hexane, 1:2); mp: 481.1–483.5 K (dec.).

¹H NMR (700.2 MHz, CDCl₃, 298 K) δ 18.73 (s, 1H, CH= Ru), 7.46 (dd, $J = 1.2, 7.5$ Hz, 1H, H-4-C₆H₄), 7.10–6.96 (m, 6H, H-3-C₆H₄, H-5-C₆H₄, H-Mes), 6.57 (d, $J = 6.7$ Hz, 1H, H-6-C₆H₄), 5.36 (d, $J = 8.1$ Hz, 1H, CH₂N-A), 4.04 (br.s, 4H, NCH₂CH₂N), 5.36 (br.s, 1H, CH₂N-B), 3.15 (s, 1H, NCH₂CH₂OMe-A), 3.09 (s, 3H, NCH₃), 3.01 (m, 2H, NCH₂CH₂O), 2.58 (s, 6H, Mes-Me), 2.41 (s, 12H, Mes-Me), 2.17 (s, 1H, NCH₂CH₂OMe-B), 1.80 (s, 3H, OCH₃).

¹³C NMR (176.1 MHz, CD₂Cl₂, 298 K) δ 314.0, 212.6, 148.1, 139.0 (4C), 138.5, 136.7 (2C), 133.3, 130.9 (2C), 129.8 (2C), 129.6 (2C), 128.7, 128.4, 126.8, 69.5 (2C), 66.0, 60.9, 58.3, 51.7, 46.2, 21.2 (3C), 19.6 (3C).

IR $\nu_{\text{max}}/\text{cm}^{-1}$ (KBr pellets): 3438, 3258, 2910, 1953, 1632, 1610, 1485, 1440, 1410, 1280, 1264, 1073, 1011, 953, 940, 850, 804, 745. HRMS (ESI-TOF): calculated for C₃₃H₄₃ClNORu [$M - \text{Cl}$]⁺ 634.2133; found 634.2138.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 4. All C-bound H atoms were included in the refinement using the riding-model approximation with C—H distances of 0.95–0.99 \AA , and with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{C})$. The measurements of the 0 0 2, 1 0 1, 0 1 1, $\bar{1}$ 0 1 and $\bar{1}$ 1 2 reflections were affected by the beam stop and

they were therefore excluded from the refinement. The Cl2 chlorine atom and the atoms of the 2-methoxy-*N*-methyl-*N*[(2-methylphenyl)methyl]ethane-1-amine group of the title complex are disordered over two sites with refined occupancy factors of 0.889 (2) and 0.111 (2). SADI, SIMU, SAME and EADP instructions were used to refine disordered atoms.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
