Redetermination of the crystal structure of di- μ_2 -hydroxido-bis[di-*tert*-butylchloridotin(IV)] at 100 K

Hans Reuter*

Chemistry, Osnabrück University, Barbarastr. 7, 49069 Osnabrück, Germany. *Correspondence e-mail: hreuter@uos.de

The structure of the dimeric title compound, $[\text{Sn}_2(\text{C}_4\text{H}_9)_4\text{Cl}_2(\text{OH})_2]$, was redetermined at 100 K by use of an area detector to provide new data to improve the structural parameters for detailed analysis. Noteworthy is the folding of the central, non-symmetric, four-membered $[\text{SnO}]_2$ ring [dihedral angle about the $\text{O}\cdots\text{O}$ axis = 1.09 (3) $^\circ$], as well as the elongation of the Sn—Cl bonds [mean value = 2.5096 (4) Å], as a result of intermolecular $\text{O}-\text{H}\cdots\text{Cl}$ hydrogen bonds; the latter lead to a chain-like arrangement of dimeric molecules along [101].

Structure description

The title compound, $[^{\text{t}}\text{Bu}_2\text{Sn}(\text{OH})\text{Cl}]_2$, belongs to the class of dimeric diorganotin(IV)-hydroxides-halides, $[\text{R}_2\text{Sn}(\text{OH})\text{X}]_2$, the first hydrolysis products of diorganotin(IV) dihalides, R_2SnX_2 . The structure of the title compound has been determined previously at room temperature using point detector data as part of a paper describing the series of dimeric di-*tert*-butyltin(IV) hydroxide halides, $[^{\text{t}}\text{Bu}_2\text{Sn}(\text{OH})\text{X}]_2$ with $\text{X} = \text{F}, \text{Cl}$ and Br (Puff *et al.*, 1985). This series was completed when a second modification of the title compound was reported (Di Nicola *et al.*, 2011) and more recently, when the crystal structures of the pure iodide compound, $[^{\text{t}}\text{Bu}_2\text{Sn}(\text{OH})\text{I}]_2$ (Reuter, 2022) and its DMSO-adduct (Reuter & Wilberts, 2014) were published. With two well-resolved, low-temperature crystal-structure determinations of the iodide derivative, it seemed reasonable to redetermine the structure of the chloride derivative using similar experimental conditions to enable a more valid comparison between structures.

As a result of the low-temperature measurement and the high data redundancy, combined with a multi-scan absorption correction, the new data improve the structural parameters of the title compound (Fig. 1) by an order of magnitude. In particular, the new data enable the confirmation of the exceptionally long Sn—C bonds [range: 2.180 (1) to

Table 1
Hydrogen-bond geometry (\AA , $^\circ$).

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
O1—H1 \cdots Cl2 ⁱ	0.96	2.30	3.2469 (10)	169
O2—H2 \cdots Cl1 ⁱⁱ	0.96	2.31	3.2482 (10)	166

Symmetry codes: (i) $x + \frac{1}{2}, -y + \frac{1}{2}, z + \frac{1}{2}$; (ii) $x - \frac{1}{2}, -y + \frac{1}{2}, z - \frac{1}{2}$.

2.184 (1) \AA ; mean value: 2.182 (2) \AA] in accord with comparable values found in related $[{}^{\prime}\text{Bu}_2\text{Sn}(\text{OH})\text{I}]_2$ compounds [pure state: $d(\text{Sn}-\text{C})_{\text{mean}} = 2.190$ (3) \AA (Reuter, 2022), and DMSO-adduct: $d(\text{Sn}-\text{C})_{\text{mean}} = 2.193$ (10) \AA (Reuter & Wilberts, 2014)].

The other structural features of note relate to the *tert*-butyl groups, which are characterized by C—C bond lengths in the range from 1.521 (2) to 1.532 (2) \AA [mean value: 1.527 (4) \AA], $\text{C}_{\text{methyl}}-\text{C}-\text{C}_{\text{methyl}}$ angles in the range 107.1 (1) to 111.1 (1) $^\circ$ [mean value: 109.5 (11) $^\circ$] and Sn—C—C angles of 107.1 (1) to 111.1 (1) $^\circ$ [mean value: 108.9 (12) $^\circ$]. These new data are of the same precision and absolute values as those found in the iodide compound both in the pure state [$d(\text{C}-\text{C}) = 1.529$ (4) \AA , $\langle (\text{C}_{\text{methyl}}-\text{C}-\text{C}_{\text{methyl}}) \rangle = 109.9$ (4) $^\circ$, $d(\text{Sn}-\text{C}) = 2.193$ (10) \AA and $\langle (\text{Sn}-\text{C}-\text{C}) \rangle = 109.4$ (7) $^\circ$ (Reuter, 2022)], and in the DMSO-adduct [$d(\text{C}-\text{C}) = 1.529$ (4) \AA , $\langle (\text{C}_{\text{methyl}}-\text{C}-\text{C}_{\text{methyl}}) \rangle = 109.9$ (4) $^\circ$ and $\langle (\text{Sn}-\text{C}-\text{C}) \rangle = 109.4$ (7) $^\circ$ (Reuter & Wilberts, 2014)].

As the molecule belongs to point group C_1 , the central, four-membered, rhombic $[\text{SnO}]_2$ ring is not exactly planar but folded along the O \cdots O axis with an interplanar angle of 1.09 (3) $^\circ$. As usual, the bond lengths and angles within the

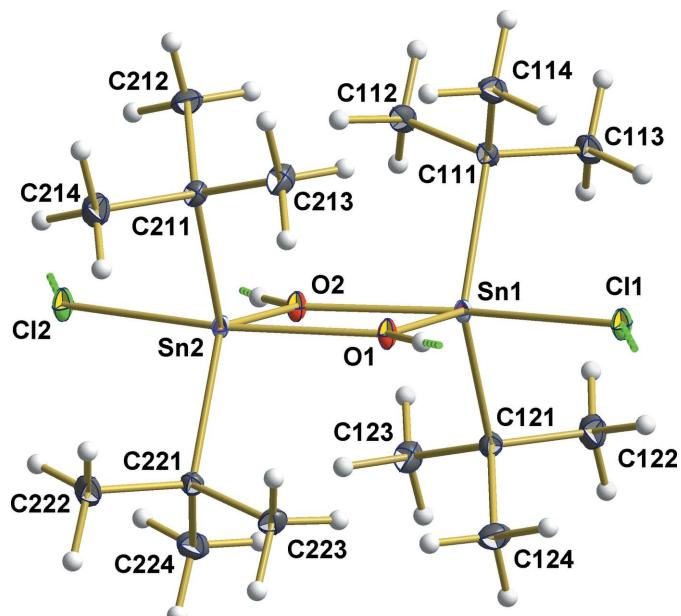

Figure 1

A representation of the dimeric, non-symmetric molecule found in the crystal of $[{}^{\prime}\text{Bu}_2\text{Sn}(\text{OH})\text{Cl}]_2$, showing the atom numbering. With the exception of the hydrogen atoms, which are shown as spheres of arbitrary radius, all other atoms are drawn with displacement ellipsoids at the 40% probability level. Intermolecular O—H \cdots Cl hydrogen bonds are indicated by dashed sticks in green.

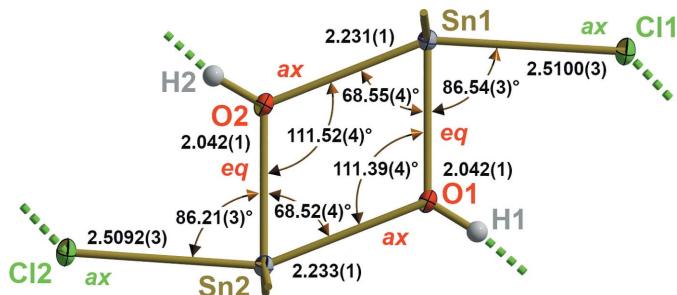

Figure 2

Ball-and-stick model of the inorganic framework of the $[{}^{\prime}\text{Bu}_2\text{Sn}(\text{OH})\text{Cl}]_2$ molecule highlighting selected bond lengths (\AA) and angles ($^\circ$). Positions of oxygen and chloride atoms within the trigonal-bipyramidal coordination of the tin atoms are labelled by use of the abbreviation *ax* (= axial) and *eq* (= equatorial). For clarity, *tert*-Bu groups are stripped down to the Sn—C bonds drawn as shortened sticks. Intermolecular O—H \cdots Cl hydrogen bonds are indicated by dashed sticks in green.

inorganic part of the molecule (Fig. 2) are characteristic of tin(IV) in trigonal-bipyramidal coordination (*ax/eq*), and the size of the *tert*-butyl groups. A special feature of the title compound relates to the Sn—Cl distances [mean value: 2.5096 (4) \AA], which are considerably longer in comparison with other Brønstedt-Base (BB) stabilized diorganotin(IV)-hydroxide-chlorides [$R = \text{Ph}$, BB = EtOH: $d(\text{Sn}-\text{Cl}) = 2.4748$ (6) \AA (Barba *et al.*, 2007); $R = \text{Ph}$, BB = quinoline: $d(\text{Sn}-\text{Cl}) = 2.4648$ (11)/2.4353 (12) \AA (Anacona *et al.*, 2003)].

These unusually long Sn—Cl bonds in the title compound arise from the fact that the chloride atoms are involved in intermolecular O—H \cdots Cl hydrogen bonds (Table 1), resulting in a chain-like arrangement of the $[{}^{\prime}\text{Bu}_2\text{Sn}(\text{OH})\text{Cl}]_2$ molecules along [101], Fig. 3, a feature that had been recognized previously but now is confirmed unambiguously.

Synthesis and crystallization

For the synthesis of the title compound, see Puff *et al.* (1985).

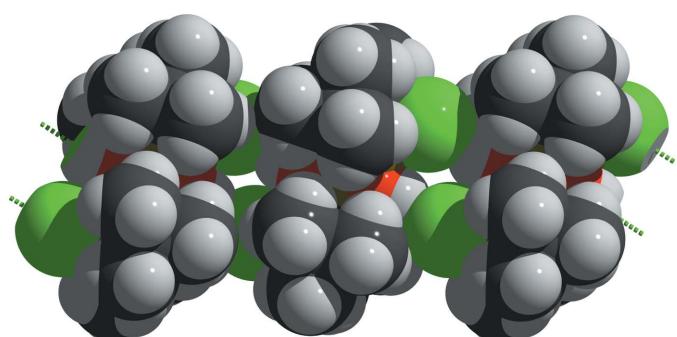

Figure 3

Space-filling model of the chain-like arrangement of the $[{}^{\prime}\text{Bu}_2\text{Sn}(\text{OH})\text{Cl}]_2$ molecules along [101] encompassing intramolecular O—H \cdots Cl hydrogen bonding. The image shows three complete molecules with their hydrogen bonds to neighbouring molecules. The corresponding atoms are visualized as truncated, two-coloured spheres and the hydrogen bonds are indicated by dashed sticks in green. Colour code of the atoms: Cl = green, H = white, C = grey, O = red, Sn = brass.

Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Six reflections were omitted from

the final cycles of refinement owing to poor agreement; details are given in the CIF.

Funding information

The Deutsche Forschungsgemeinschaft and the Government of Lower-Saxony are thanked for the funding of the diffractometer. Additional support by the Deutsche Forschungsgemeinschaft (DFG) is also acknowledged.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Six reflections, i.e. (-1 1 1), (1 1 0), (0 2 1), (0 1 1), (1 0 1) and (0 0 2), were omitted from the final cycles of refinement owing to poor agreement.

The positions of all H atoms were clearly identified in difference Fourier syntheses. Those of the *tert*-butyl groups were refined with calculated positions (C—H = 0.98 Å) and common $U_{\text{iso}}(\text{H})$ parameters for each of the methyl groups. The position of the H atoms of the OH groups were refined with a fixed O—H distance of 0.96 Å before they were fixed and allowed to ride on their parent atoms with a common $U_{\text{iso}}(\text{H})$ parameter.
