08.2-3

THE CRYSTAL STRUCTURE OF A NEW COBALT OXIDE SULFATE, $\mathrm{Bi}_{2} \mathrm{COO}_{3} \mathrm{SO}_{4}$. By I.A. Fanariotis and P.J.Rentzeperis, Applied Fhysics Laboratory, Aristotle University of Thessaloniki, Thessaloniki, Greece.

The crystal structure of $\mathrm{Bi}_{2} \mathrm{COO}_{3} \mathrm{SO}_{4}$ was determined within the framework of a systematic study of the various phases in the system $\mathrm{CoSO}_{4}-\mathrm{Bi}_{2} \mathrm{O}_{3}$, prepared under different conditions.

The compound was synthesized in a crystalline form by heating a mixture of $\mathrm{COSO}_{4}$ and $8 i_{2} \mathrm{O}_{3}$. The crystal structure has been determined from three-dimensional $X$-Ray diffraction data, collected on a computer-controlled Philips PW 1100 single crystal diffractometer ( 845 observed reflections). The crystals are orthorhombic, $P b c m, a=$ $7.123(2), b=15.762(4), c=5.416(2) \AA, 8=4$. The positional and thermal parameters were refined by full-matrix, least-squares calculations, to a final $R=0.042$. The structure in layered, with $\left[\mathrm{Bi}_{2} \mathrm{COO}_{3}\right]_{\mathrm{n}}$ layers normal to the a axis, interlinked by 50 groups (Fig. 1).

The Bi atoms, located by MULTAN, occupy two different positions and are seven coordinated, by four 0 atoms belonging to the layer and forming with them square pyramids (average distances : $\mathrm{Bi}(1)-0=2.255$ and $\mathrm{Bi}(2)-0=2.245 \AA$ ) and three 0 atoms of the sulfate groups (average distances : Bi (1) $-0=2.79$ and $8 i(2)-0=2.95 \AA$ ). The Bi-0 bonds to the latter may be considered as secondary bonds. The Co atom is six coordinated by four 0 atoms, again belonging to the layer, at the base of a square pyramid (average Co-0 $=2.07 \AA$ ) and two further 0 atoms of the sulfate group at a distance 2.41 A . The six 0 atoms form a trigonal prism. The coordination of the 0 atoms in a layer is tetrahedral. Distances and angles are normal. The $\mathrm{SO}_{4}$ tetrahedron is only slightly distorted with an average $5-0=1.47 \AA$. The layered structure explains very well the plate-like growth of the crystals normal to a.

Fig. 1. Clinographic projection along the $c$ axis.
08.2-4 CRYSTAL STRUCTURES OF SEVEN CADMIUM SELENITES. By J. Valkonen, University of Jyväskylä, Department of Chemistry, SF-40100 Jyväskylä, Finland.

Seven cadmium selenite compounds have been synthesized and their crystal structures have been solved using direct methods and least squares refinement. $\alpha-\mathrm{CdSeO}_{3}$ was found to be isomorphous with corresponding $\mathrm{Mg}, \mathrm{Mn}$, $\mathrm{Co}, \mathrm{Ni}, \mathrm{Cu}$ and Zn selenites (Kohn, Inoue, Horie and Akimoto, J. Solid State Chem. 1976, 18, 27).

| Formula | a(A) | $b(A)$ | $c(A)$ | $B\left(^{\circ}\right.$ ) | Z | SPGR |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\mathrm{Cd}_{3}\left(\mathrm{HSSO}_{3}\right)_{2}\left(\mathrm{SeO}_{3}\right)_{2}$ | 9.405 | 9.147 | 7.284 | 112.62 | 2 | $\mathrm{P}_{2} / \mathrm{C}$ |
| $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Cd}\left(\mathrm{SeO}_{3}\right)_{2}$ | 5.714 | 5.714 | 20.033 |  | 3 | R $\overline{3}$ |
| $\underline{\mathrm{Cd}\left(\mathrm{NH}_{3}\right) \mathrm{SeO}_{3}}$ | 13.306 | 6.136 | 5.125 |  | 4 | Prma |

Coordination number of cadmium is six in all compounds except $\mathrm{Cd}_{3}\left(\mathrm{HSeO}_{3}\right)_{2}\left(\mathrm{SeO}_{3}\right)_{2}$. This has two different cadmium atoms with coordination numbers 6 and 7. Coordination polyhedron is octahedron for all six coordinated cadmium atoms except $\beta-\mathrm{CdSeO}_{3}$, in which it is trigonal prism. Seven coordinated cadmium forms monocapped trigonal prism. Octahedra around cadmium atoms in $\mathrm{CdSeO}_{3} * \frac{\mathrm{H}_{2}}{4} \mathrm{O}$ are very distorted.

| Formula | $R(\%)$ | $N_{\text {ref }}$ | $N_{\text {as }}$ | $C d-O(\AA)$ | $\mathrm{Se}-\mathrm{O}(\AA)$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\alpha-\mathrm{CdSeO}_{3}$ | 2.1 | 730 | 1 | 2.33 | 1.71 |
| $\beta-\mathrm{CdSeO}_{3}$ | 4.4 | 2826 | 2 | 2.31 | 1.69 |
| $\mathrm{CdSeO}_{3} * \frac{3}{4} \mathrm{H}_{2} \mathrm{O}$ | 2.4 | 3652 | 4 | 2.30 | 1.70 |
| $\mathrm{CdSe}_{2} \mathrm{O}_{5}$ | 2.8 | 1242 | 1 | 2.29 | 1.66 |
| $\mathrm{Cd}_{3}\left(\mathrm{HSeO}_{3}\right)_{2}\left(\mathrm{SeO}_{3}\right)_{2}$ | 3.4 | 2553 | 2 | 2.35 | 1.70 |
| $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Cd}^{\left(\mathrm{SeO}_{3}\right)_{2}}$ | 1.2 | 293 | 1 | 2.32 | 1.69 |
| $\mathrm{Cd}\left(\mathrm{NH}_{3}\right) \mathrm{SeO}_{3}$ | 2.0 | 831 | 1 | 2.33 | 1.69 |

$N_{\text {ref }}=$ number of refined reflections ( $I>3 * \sigma(I)$ )
$\mathrm{N}_{\mathrm{as}}=$ number of asymmetric Cd and Se atoms
Previous table shows average $\mathrm{Cd}-0$ and $\mathrm{Se}-0$ distances, but it does not contain diselenite $\mathrm{Se}-0(-\mathrm{Se})$ or hydrogenselenite $\mathrm{Se}-\mathrm{O}(-\mathrm{H})$ distances, which are 1.80 and 1.75 A , respectively.

A11 compounds form three-dimensional network. NH3 group in $\mathrm{Cd}\left(\mathrm{NH}_{3}\right) \mathrm{SeO}_{3}$ is coordinated to cadmium. Cd-N distance is $2.30 \mathrm{~A} . \mathrm{NH}_{4}$ in $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Cd}\left(\mathrm{SeO}_{3}\right)_{2}$ is not coordinated to cadmium.
