Drawing from our collective experience as structural biologists, data scientists, and educators developing and managing the RCSB PDB and other related resources, we have created an open access modular educational curriculum covering concepts, approaches and requirements for developing and managing the full data pipeline for a curated public archive of biological experimental data. The online curriculum makes best practices recommendations for data resource management based on the extensive experience accumulated by the RCSB team. The intended audience includes scientists, who can use the materials for self-instruction, as well as librarians and information specialists, who can use the materials to develop training services for students, scientists, and staff at their organizations. In addition, the curriculum is intended to help catalyze formation of federated model and data archives to accelerate progress in Integrative Structural Biology. We have produced eight modules that can either be studied separately or assembled into a complete set as an open online course. Curriculum materials include professionally produced videos, powerpoint slides, and a set of exercises to guide students step-by-step to design, create, and query their own database.

This education development project was funded by National Institutes of Health National Library of Medicine as part of the NIH Big Data to Knowledge (BD2K) Initiative (R25 LM012286). Project website: <http://edsb.rcsb.org>
