

Growing protein crystals under different conditions

Andrej Arendt¹

¹*Karl Popper Schule*

ipatova@westostwest.de

I had heard about protein crystals and found the topic interesting, so I decided to do a thesis on it.

This also taught me how important these are for medicine, the pharmaceutical industry and science.

In my work I try to grow protein crystals under different framework conditions. The framework conditions include, among others: temperature, pressure and various solution compositions.

After the better framework conditions, I try to get several stable crystallization results in my work. As a protein I will use lysozyme from different jellyfish.
