Exploiting fast detectors to enter a new dimension in room-temperature crystallography

Robin L. Owen, Neil Paterson, Danny Axford, Jun Aishima, Clemens Schulze-Briese, Jingshan Ren, Elizabeth E. Fry, David I. Stuart and Gwyndaf Evans

Table S1 Dose rates used and observed crystal lifetimes for the thaumatin and BEV 2 crystals. The lifetime is given as the dose required to reduce the diffracting power to 85% of the initial diffracting power, D_{85} . The mean for each crystal type and dose-rate is shown in figure 6, the mean lifetimes of each crystal type is shown as a function of dose-rate in figure S1.

Crystal	Dose Rate / kGy s ⁻¹	D_{85} / kGy
Thaumatins 1	687	144
Thaumatins 2	687	192
Thaumatins 3	687	150
Thaumatins 4	1320	418
Thaumatins 5	1320	249
Thaumatins 6	1320	276
Thaumatins 7	1320	303
Thaumatins 8	1320	348
Thaumatins 9	1320	177
Thaumatins 10	1320	475
Thaumatins 11	1320	386
BEV 1	2494	422
BEV 2	2494	328
BEV 3	2494	376
BEV 4	2494	649
BEV 5	2494	685
BEV 6	2494	431
BEV 7	3840	321
BEV 8	3840	425
BEV 9	3840	393
BEV 10	3840	322
BEV 11	3840	502
BEV 12	3840	365
BEV 13	4800	863
BEV 14	4800	873
BEV 15	4800	531
BEV 16	4800	711
BEV 17	4800	537
BEV 18	4800	608

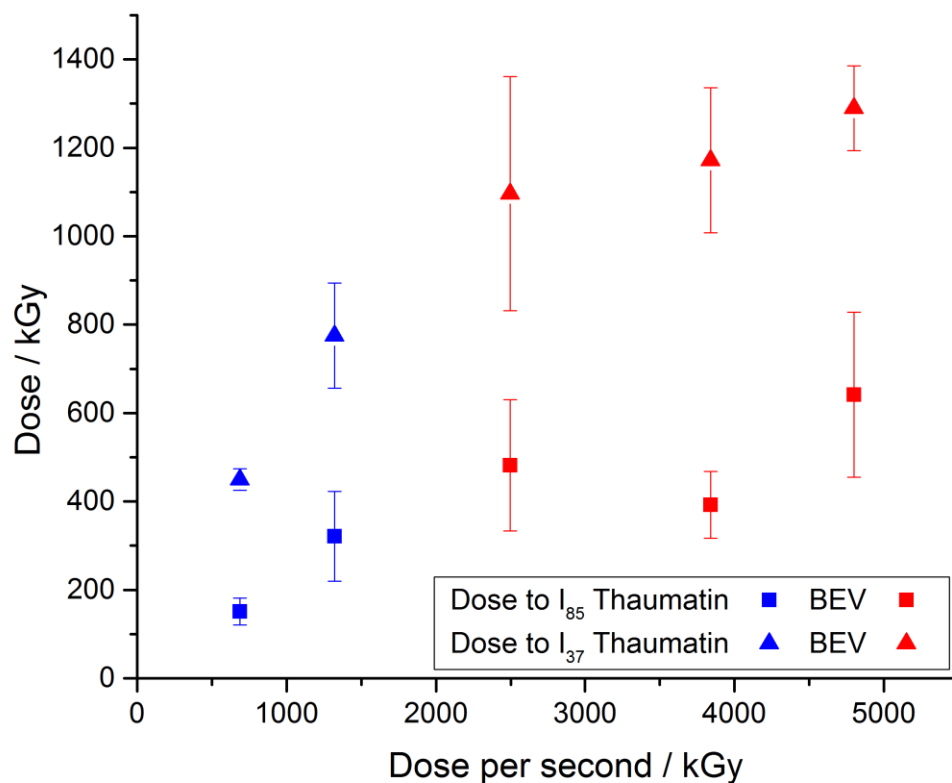

Figure S1 Lifetime of BEV and thaumatin crystals as a function of dose-rate determined using a fitted dose-response curve. Two lifetimes are shown: the dose required to reduce the diffracting power of crystals to 85% of the initial diffracting power, and also the dose required to reduce the diffracting power of crystals to 37% (*i.e.* approximately equivalent the decay constant of an exponential function). These data are shown overlaid on data from Owen *et al.* (2012) in figure 6.
