## A low-temperature determination of butyramide

The low-temperature structure determination of butyramide, $\mathrm{C}_{4} \mathrm{H}_{9} \mathrm{NO}$, obtained as part of a experimental polymorph screen on adenine, is reported here. Each molecule takes part in four hydrogen bonds to form a three-dimensional ribbon structure.

## Comment

The title compound, (I), is one of the $n$-aliphatic amides and has recently been studied as a possible agent for growth inhibition of human neuroblastoma cell lines (Rocchi et al., 1998) and inhibitory effects on DNA synthesis on hepatoma cells (Lea et al., 1993).

(I)

The powder diffractogram data for (I) were reported in 1950 (Matthews et al., 1950), as part of a study on derivatives of fatty acids, and the unit cell was determined five years later (Turner \& Lingafelter, 1955) using Weissenberg photographs, to give $a=9.94 \AA, b=5.79 \AA, c=10.02 \AA$ and $\beta=100.9^{\circ}$. Examination of the systematic absences showed the space group to be $P 2_{1} / a$; however, no atomic coordinates were published. We have solved and refined the crystal structure of butyramide at 150 K , to give a final $R$ value of 0.041 . There is a $12^{\circ}$ difference in the $\beta$ angle between the two determinations. In (I), the bond lengths and angles are within expected values (Allen et al., 1987), with the $\mathrm{C}-\mathrm{C}$ bond lengths in the range 1.5057 (18) -1.515 (2) $\AA$ and with $\mathrm{N} 1-\mathrm{C} 1$ and $\mathrm{O} 2-\mathrm{C} 1$ bond lengths of 1.3257 (15) and 1.2395 (13) $\AA$, respectively. There is a relative twist of the carbon chain from planarity, with torsion angles $\mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 3-\mathrm{C} 4$ and $\mathrm{N} 1-\mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 3$ of 177.41 (21) and $151.62(12)^{\circ}$, respectively. The packing consists of

Figure 1

Received 9 May 2005 Accepted 27 May 2005 Online 10 June 2005
centrosymmetric dimers, linked through a pair of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds [2.9470 (15) $\AA$ ]. The other amine H atom is used to hydrogen bond to an adjacent dimer unit which is approximately perpendicular ( $73^{\circ}$ ), through an $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond [2.8496 (14) Å], resulting in the formation of a three-dimensional criss-crossed ribbon structure (Fig. 2).

## Experimental

As part of an experimental polymorph screen on adenine, (I) was obtained from a 0.3 M aqueous solution of (I), to which approximately 0.15 g of adenine was added, and which was stirred on a hotplate at 303 K for 3 d . This solution was filtered, then evaporated at room temperature ( 10 ml solution, in $75 \times 25 \mathrm{~mm}$ vessels) in an attempt to crystallize adenine, as it has been found that the solubility of purine and pyrimidine bases increases in aqueous amide solutions (Herskovits \& Bowen, 1974). Colourless block-like crystals of (I) were formed after a number of days.

## Crystal data

$\Delta \rho_{\text {max }}=0.19 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\min }=-0.12 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
