## Key indicators

Single-crystal X-ray study
$T=150 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.001 \AA$
$R$ factor $=0.044$
$w R$ factor $=0.091$
Data-to-parameter ratio $=66.2$

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## trans-1,4-Dimethylcyclohexane

trans-1,4-Dimethylcyclohexane, $\mathrm{C}_{8} \mathrm{H}_{16}$, was studied as part of a project to develop a computer-controlled low-temperature crystal-growing device. The liquid crystallizes with the molecule lying on a centre of symmetry, leading to $Z^{\prime}=\frac{1}{2}$.

## Comment

trans-1,4-Dimethylcyclohexane, (I) (Fig. 1), was one of eight alkylcyclohexanes whose thermodynamic properties were published in 1949 (Huffman et al., 1949). That work reported a melting point of 236.217 K and showed no evidence for phase changes in the range down to liquid-nitrogen temperatures.

(I)

The sample used for the present study was one of several sealed in 0.2 mm Lindeman tubes for preliminary work carried out in 1979. Data had been collected at that time on a Stoe Weissenberg diffractometer and the structure solved, but it was not of a publishable quality (Courseille et al., 1979).

The sample solidified spontaneously to a polycrystalline mass on flash cooling to 150 K . The temperature was then raised to 230 K and the sample zone-refined into a singlecrystal using tandem computer-controlled heating elements. The temperature was then slowly reduced to 150 K for data collection.

The structure of (I) consists of molecules lying on centres of symmetry. This leads to the packing consisting of columns of molecules lying along the $b$ axis (Fig. 2), with the mean plane of the molecule inclined at $145^{\circ}$ to that axis (Fig. 3).

Figure 1
The structure of (I), with displacement ellipsoids drawn at the $50 \%$ probability level and H atoms shown as spheres of arbitary radii. Unlabelled atoms are related to labelled atoms by a centre of symmetry.

Received 9 December 2005 Accepted 16 December 2005 Online 7 January 2006

Figure 2
A projection of (I) along the $b$ axis. The low specific gravity $\left(0.98 \mathrm{Mg} \mathrm{m}^{-3}\right)$ is explained by the open texture of the structure.

## Experimental

The material was used as supplied by Aldrich Chemical Company Inc. in 1979.
