Received 20 November 2007; accepted 22 November 2007

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.051; wR factor = 0.164; data-to-parameter ratio = 14.1.

In the title compound, $\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}$, the molecular core is planar, with a central $\text{C}=\text{N}-\text{C}$ torsion angle of $-179.3(3)^\circ$. However, the overall geometry is not planar, with a dihedral angle of $61.96(1)^\circ$ between the two benzene rings, which adopt a *trans* configuration with respect to the $\text{C}=\text{N}$ bond [$1.269(4)$ Å]. The bond lengths and angles are within normal ranges

N-[4-(Dimethylamino)benzylidene]-4-ethoxyaniline

Qiang Wang and Da-Qi Wang

S1. Comment

Schiff bases have been intensively investigated recently owing to their strong coordination capability and diverse biological activities, such as antibacterial, antitumor activities *etc.* (Yang *et al.*, 2000; Mondal *et al.*, 2001; Tarafder *et al.*, 2002). We report here the synthesis and crystal structure of the title new Schiff base C₁₇H₂₀N₂O, (I).

The molecular structure of (I) is shown in Fig. 1. The molecular core is planar, with a central C—N?C—C torsion angle of -179.3 (3)°. The overall geometry instead, is not, with a dihedral angle of 61.96 (1)° between the two benzene rings, which adopt a *trans* configuration with respect to the C?N bond [1.269 (4) Å]. The bond lengths and angles are within normal ranges.

S2. Experimental

P-dimethylamino benzaldehyde (5 mmol, 746.0 mg) in absolute ethanol (15 ml) was added dropwise to a absolute ethanol solution (5 ml) of *p*-ethoxyaniline (5 mmol, 685.9 mg). The mixture was heated under reflux with stirring for 3 h and then filtered. The resulting clear solution was kept at room temperature for 10 days, after which large pale-yellow block-shaped crystals of the title compound suitable for X-ray diffraction analysis were obtained.

S3. Refinement

All H-atoms were positioned geometrically and refined using a riding model, with C—H = 0.96 Å (methyl), 0.97(Å) (methylene), 0.93 Å (methenyl), 0.93 Å (aromatic), and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
