Correspondence e-mail: xiachc@163.com

Received 27 November 2007; accepted 28 November 2007

Key indicators: single-crystal X-ray study; $T = 273$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.030; wR factor = 0.124; data-to-parameter ratio = 12.2.

In the title compound, $\text{C}_{11}\text{H}_8\text{N}_2\text{O}_2$, the packing is consolidated by $\text{C}-\text{H}\cdots\text{N}$ and $\text{C}-\text{H}\cdots\text{O}$ interactions.

3-(1,3-Dioxoisindolin-2-yl)propanenitrile

Xiao-Jun Li, Ming-Hui Xiong and Cheng-Cai Xia

S1. Comment

Isoindoline-1,3-dione derivatives exhibit a high level of biological activity (Wingrove & Caret, 1981). As a part of our studies in this area, we have isolated the title compound, (I), (Fig. 1).

As expected, the six-membered and five-membered rings are almost co-planar [dihedral angle = 0.67 (6)°]. In the crystal of (I), C—H···O and C—H···N interactions (Table 1) help to establish the packing (Fig. 2).

S2. Experimental

The title compound was synthesized from a mixture of isoindoline-1,3-dione (5 mmol, 0.736 g) and 3-chloropropanenitrile (5 mmol, 0.448 g) and triethylamine (8 mmol, 0.505 g) and 30 ml *N,N*-dimethylformamide. The components were dissolved in 20 ml ethanol and 2 ml water, then heated to boiling and stirred for ten minutes. The system was cooled to the room temperature and colourless blocks of (I) were collected after six days.

Figure 1

The molecular structure of (I), showing 30% probability displacement ellipsoids for the non-hydrogen atoms.

Figure 2

Part of the crystal structure of (I), with hydrogen bonds shown as thin lines.

 $w = 1/[\sigma^2(F_o^2) + (0.1P)^2 + 0.04P]$ where $P = (F_o^2 + 2F_c^2)/3$ $(\Delta/\sigma)_{\max} = 0.002$ $\Delta\rho_{\max} = 0.13 \text{ e } \text{\AA}^{-3}$ $\Delta\rho_{\min} = -0.12 \text{ e } \text{\AA}^{-3}$ Extinction correction: *SHELXL97* (Sheldrick,
1997a), $F_c^* = kF_c[1 + 0.001 \times F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$

Extinction coefficient: 0.104 (13)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
