

2-Bromobenzaldehyde cyanohydrin

Richard Betz, Franziska Betzler and Peter Klüfers*

Ludwig-Maximilians-Universität, Department Chemie und Biochemie, Butenandtstrasse 5–13, 81377 München, Germany

Correspondence e-mail: kluef@cup.uni-muenchen.de

Received 3 October 2007; accepted 9 October 2007

Key indicators: single-crystal X-ray study; $T = 200$ K; mean $\sigma(\text{C}—\text{C}) = 0.004$ Å; R factor = 0.032; wR factor = 0.083; data-to-parameter ratio = 18.1.

The title compound [alternatively called (2-bromophenyl)-(hydroxy)acetonitrile], $\text{C}_8\text{H}_6\text{BrNO}$, is the reaction product of 2-bromobenzaldehyde and hydrogen cyanide. Bond lengths and angles are normal. In the crystal structure, an intermolecular hydrogen bond between the hydroxy group and the nitrile N atom is established. In agreement with bonding considerations, a linear $\text{C}—\text{N} \cdots \text{H}$ acceptor geometry is observed. Each molecule is a single donor and a single acceptor; extended hydrogen-bonded chains are formed along [100].

2-Bromobenzaldehyde cyanohydrin

Richard Betz, Franziska Betzler and Peter Klüfers

S1. Comment

The title compound was prepared as an intermediate in the synthesis of 2-bromomandelic acid.

In the title compound a phenyl moiety, a hydroxy group and a cyano group are bonded to one C atom. The aromatic moiety bears a Br atom in 2- position to this C atom (Fig. 1). Bond lengths and angles show no significant deviations from values apparent in the literature for similar bonds (Allen *et al.*, 1987).

In the crystal structure, hydrogen bonds between the hydroxy groups and the N atom result in the formation of infinite chains along [100]. The aromatic moieties are arranged parallel to each other (Fig. 2).

S2. Experimental

The title compound was obtained as an intermediate in the synthesis of 2-bromomandelic acid according to a published procedure (Becker *et al.*, 2001) upon addition of 2-bromobenzaldehyde to an acidified aqueous solution of potassium cyanide. After workup, crystals suitable for X-ray analysis were obtained upon free evaporation of a solution of the compound in diethylether.

S3. Refinement

All H atoms were located in a difference map and refined as riding on their parent atoms. One common isotropic displacement parameter for all H atoms was refined.

Figure 1

The molecular structure with atom labels and anisotropic displacement ellipsoids (drawn at 50% probability level) for non-H atoms.

Figure 2

The packing of viewed along $[-1\ 0\ 0]$. Hydrogen bonds are drawn as yellow bars.
