

(3-Nitrophenyl)methanediyl diacetate

Ghodsi Mohammadi Ziarani,^a Alireza Abbasi,^{b*} Alireza Badiei,^b Shima Ghorbi^a and Fatemeh Shahjafari^a^aDepartment of Chemistry, University of Alzahra, Tehran, Iran, and ^bSchool of Chemistry, University College of Science, University of Tehran, Tehran, Iran
Correspondence e-mail: aabbasi@khayam.ut.ac.ir

Received 19 November 2007; accepted 20 November 2007

Key indicators: single-crystal X-ray study; $T = 290$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.036; wR factor = 0.098; data-to-parameter ratio = 12.9.

In the title compound, $\text{C}_{11}\text{H}_{11}\text{NO}_6$, only weak van der Waals interactions are found in the molecular packing. The compound is an efficient catalyst for the acetalization of the carbonyl group of aldehydes in nearly quantitative yield.

Related literature

For background literature on silica-based sulfonic acid as catalyst in solvent-free acetalization, see: Karimi *et al.* (2000); Kumar *et al.* (2006); Smith & Reddy (2003).

(3-Nitrophenyl)methanediyl diacetate

Ghodsii Mohammadi Ziarani, Alireza Abbasi, Alireza Badiei, Shima Ghorbi and Fatemeh Shahjafari

S1. Comment

Protection of aldehydes is important in organic chemistry. Many procedures have been done for this aim. In this work, silica based sulfonic acid was used as catalyst in solvent free condition for the acetalization of 3-nitro-benzaldehyde (Karimi, *et al.*, 2000; Kumar, *et al.*, 2006; Smith, & Reddy, 2003). The time of reaction was just 10 minutes at room temperature and the yield of reaction was more than 96%. Therefore, this catalyst was very efficient catalyst for acetalization of the carbonyl group of aldehydes.

The molecular structure of (I) and the atom-numbering scheme are shown in Fig. 1. The nitro (NO₂) group is twisted regarding to phenyl ring by torsion angles of O3–N1–C3–C8, 4.8 (3)° and O6–N1–C3–C2, 7.1 (3)°. The methyne carbon are connected to two acetate ions and phenyl ring in a distorted tetrahedral configuration. The structure of the title compound was corroborated by IR and ¹H NMR spectroscopies.

S2. Experimental

The catalyst (0.02 gr) was activated under vacuum at 100 °C followed by cooling to room temperature and then 3-nitro-benzaldehyde (3 mmol) was added to the catalyst. The mixture was stirred for two minutes and acetic anhydride (0.6 ml) was then added and stirred for 10 more minutes. The obtained solid was diluted with dichloromethane and filtered to remove the catalyst. The organic layer was washed with saturated NaHCO₃ solution and dried with Na₂SO₄. The solvent was evaporated under reduced pressure to obtain the title compound in yield of 96%. Crystals suitable for crystallography was obtained by crystallization from CH₂Cl₂.

S3. Refinement

All H atoms were geometrically positioned and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2$ and 1.5 for $U_{\text{eq}}(\text{CH}$ and CH_3 , respectively).

Figure 1

Molecular structure of (I), with 50% probability displacement ellipsoids. H atoms are shown as circles of arbitrary radii.

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.036$
 $wR(F^2) = 0.098$
 $S = 0.91$

2149 reflections
 166 parameters
 0 restraints
 Primary atom site location: structure-invariant
 direct methods

Secondary atom site location: difference Fourier map	$(\Delta/\sigma)_{\max} < 0.001$
Hydrogen site location: inferred from neighbouring sites	$\Delta\rho_{\max} = 0.19 \text{ e } \text{\AA}^{-3}$
H-atom parameters constrained	$\Delta\rho_{\min} = -0.14 \text{ e } \text{\AA}^{-3}$
$w = 1/[\sigma^2(F_o^2) + (0.0565P)^2]$	Extinction correction: <i>SHELXL</i> , $F_c^* = kF_c[1 + 0.001 \times F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$
where $P = (F_o^2 + 2F_c^2)/3$	Extinction coefficient: 0.100 (9)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
