## 4-(4-Hydroxyphenyldiazenyl)benzonitrile

## Chao Zhi Zhang

Ordered Matter Science Research Center, College of Chemistry and Chemical Engineering, Southeast University, Nanjing 210096, People's Republic of China Correspondence e-mail: zhangchaozhi@seu.edu.cn

Received 1 December 2007; accepted 18 February 2008
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.007 \AA$; $R$ factor $=0.054 ; \omega R$ factor $=0.145 ;$ data-to-parameter ratio $=8.3$.

The molecule of the title compound, $\mathrm{C}_{13} \mathrm{H}_{9} \mathrm{~N}_{3} \mathrm{O}$, is achiral but forms a chiral arrangement in the crystal structure. The molecule adopts an $E$ configuration with respect to the $\mathrm{N}=\mathrm{N}$ bond and is almost planar, with an r.m.s. deviation of $0.0439 \AA$ from the plane through all atoms in the molecule. The dihedral angle between the two benzene rings is $2.2(2)^{\circ}$. In the crystal structure, intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonding generates a chain.

## 4-(4-Hydroxyphenyldiazenyl)benzonitrile

## Chao Zhi Zhang

## S1. Comment

Nitrile compounds are the precursor of tetrazole derivatives (Dunica, et al., 1991; Wittenberger, et al., 1993) and can be used for the design of noncentrosymmetric bulk materials (Xiong, et al.(2002)). We report here the crystal structure of the title compound, 4-(4-hydroxyphenylazo)benzonitrile, (I) (Fig. 1).
In I, the $\mathrm{N}=\mathrm{N}$ double bond $[1.257(4) \AA$ ] is in the range found in other similar azo complexes with a trans-configuration (Harada, et al., 1997). The torsion angle C7-N2-N3-C8 is $-179.30(0.32)^{\circ}$. The dihedral angle between the two benzene rings is $2.18(1 / 5)^{\circ}$. The crystal structure involves $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond resulting in the formation of a chain.

## S2. Experimental

A solution of 4-cyanoaniline $(0.71 \mathrm{~g}, 6 \mathrm{mmol})$ in a solution of hydrochloric acid ( $6 \mathrm{ml}, 4 M$ ) was added to a solution of sodium nitrite $(0.42 \mathrm{~g}, 6.1 \mathrm{mmol})$ in 2 ml water, and the mixture was stirred for 4 h under N 2 atmosphere at 273-278 K. Then urea ( $0.01 \mathrm{~g}, 0.2 \mathrm{mmol}$ ) was added to decompose excessive nitrous acid, and the mixture was further stirred for 30 min . The solution of the diazonium salt was added to a aqueous phenol ( $0.62 \mathrm{~g}, 6.6 \mathrm{mmol}$ ), sodium carbonate ( 3 g ), baking soda $(0.2 \mathrm{~g})$ and ice $(15 \mathrm{~g})$ at $273-278 \mathrm{~K}$. The mixture was stirred for 7 h . After the reaction solution was neutralized with a solution of hydrochoric acid $(13.6 \mathrm{ml}, 3 \mathrm{M})$, the mixture was filtrated. A yellow block-like crystals $(1.27 \mathrm{~g}, 5.7 \mathrm{mmol}, 95 \%)$, which is suitable for X-ray analysis, were obtained by recrystallization from ethyl acetate (18 ml ).

## S3. Refinement

Positional parameters of all the H atoms were calculated geometrically and were allowed to ride on the C atoms to which they are bonded, with $U_{\text {iso }}(\mathrm{H})=1.2 \mathrm{Ueq}(\mathrm{C}), \operatorname{orUiso}(\mathrm{H})=1.2 \mathrm{Ueq}(\mathrm{O})$. In the absence of significant anomalous scattering effects the Friedel pairs were merged.

Figure 1
A view of the title compound with the atomic numbering scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level.

Figure 2
The crystal packing of the title compound viewed along the $a$ axis. Hydrogen atoms not involved in hydrogen bonding (dashed lines) were omitted for clarity.

$\theta_{\text {max }}=27.5^{\circ}, \theta_{\text {min }}=3.7^{\circ}$
$h=-8 \rightarrow 8$
$k=-13 \rightarrow 13$
$l=-20 \rightarrow 20$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0762 P)^{2}\right]$
where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.17 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-0.19$ e $\AA^{-3}$
Absolute structure: indeterminate

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
