Received 10 March 2008; accepted 17 April 2008

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.044; wR factor = 0.110; data-to-parameter ratio = 15.4.

The title compound, $[\text{V}(\text{C}_{16}\text{H}_{14}\text{N}_2\text{O}_2)\text{O}]$, was synthesized by the reaction of vanadyl(IV) sulfate and *N,N'*-bis(salicylidene)-ethylenediamine under hydrothermal conditions. The asymmetric unit contains two molecules. Each V^{IV} atom is coordinated in a square-pyramidal geometry by two N atoms and two O atoms from a ligand in the basal plane and by an oxide O atom in the apical position. Weak C–H···O hydrogen bonds lead to a three-dimensional supramolecular structure.

{2,2'-[Ethylenebis(nitrilomethylidyne)]diphenolato- κ^4O,N,N',O' }oxidovanadium(IV)

Cheng Wang, Ji-Hong Yuan, Gang Xie, Ming-Juan Yu and Jing Li

S1. Comment

In the past few decades, there has been increased interest in coordination chemistry and biochemistry of oxovanadium. The main reason is that the function of vanadium in biological system has been recognized, such as the regulation of carbohydrate metabolism (Butler & Walker, 1993; Martinez *et al.*, 2001; Sun *et al.*, 1996). Generally, Schiff base is coordinated to vanadium through O and N atoms (Deng *et al.*, 2007), similar to those in the biological systems. Therefore, it is important to intensively study the relationship of syntheses and structural properties of vanadium-schiff base complexes. We report here the crystal structure of the title compound, a vanadium complex with a schiff-base ligand, *N,N'*-bis(salicylidene)ethylenediamine ($H_2\text{salen}$).

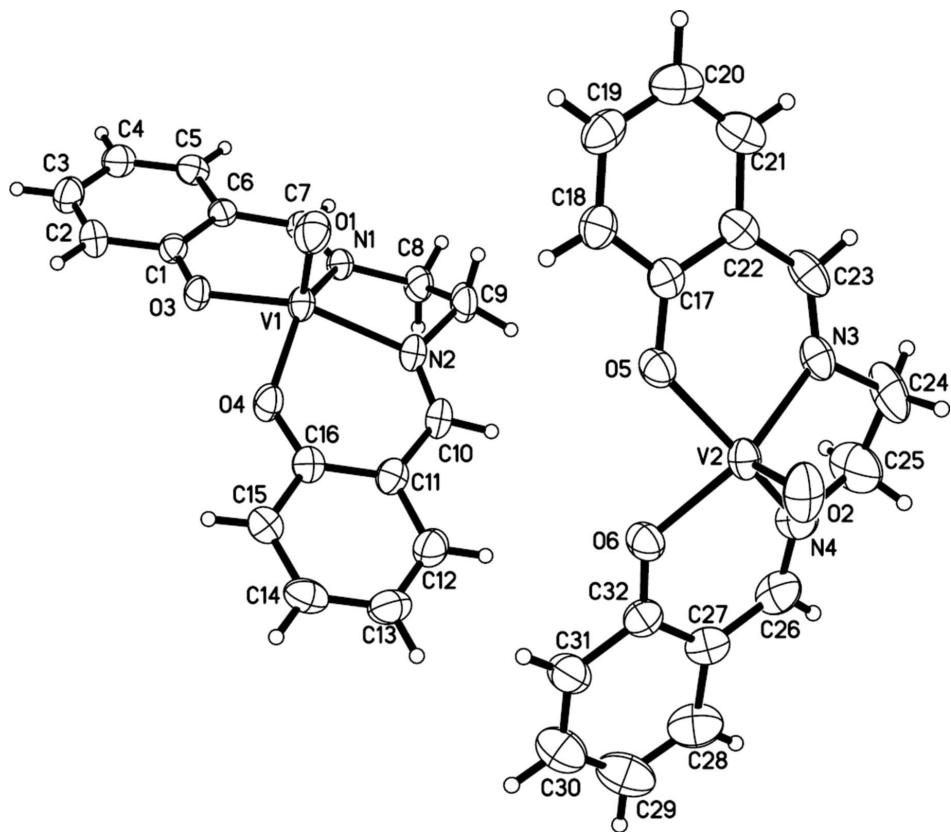

In the asymmetric unit, there are two crystallographically independent molecules (Fig. 1). Each V^{IV} atom is coordinated by two N atoms and two O atoms from a salen ligand in the equatorial plane and an oxido O atom in the apical position, resulting in a five-coordinated square-pyramidal geometry (Table 1). The $V\cdots O$ bond lengths are 1.582 (2) and 1.583 (2) Å, which are in the normal range. In the crystal structure, though each salen ligand contains two phenyl ring with dihedral angles of 156.3 (4)° and 164.1 (4)°, respectively, there are no $\pi-\pi$ interactions between the molecules. In virtue of weak intermolecular C—H \cdots O hydrogen bonds (Table 2), a three-dimensional hydrogen-bonding network is constructed (Fig. 2).

S2. Experimental

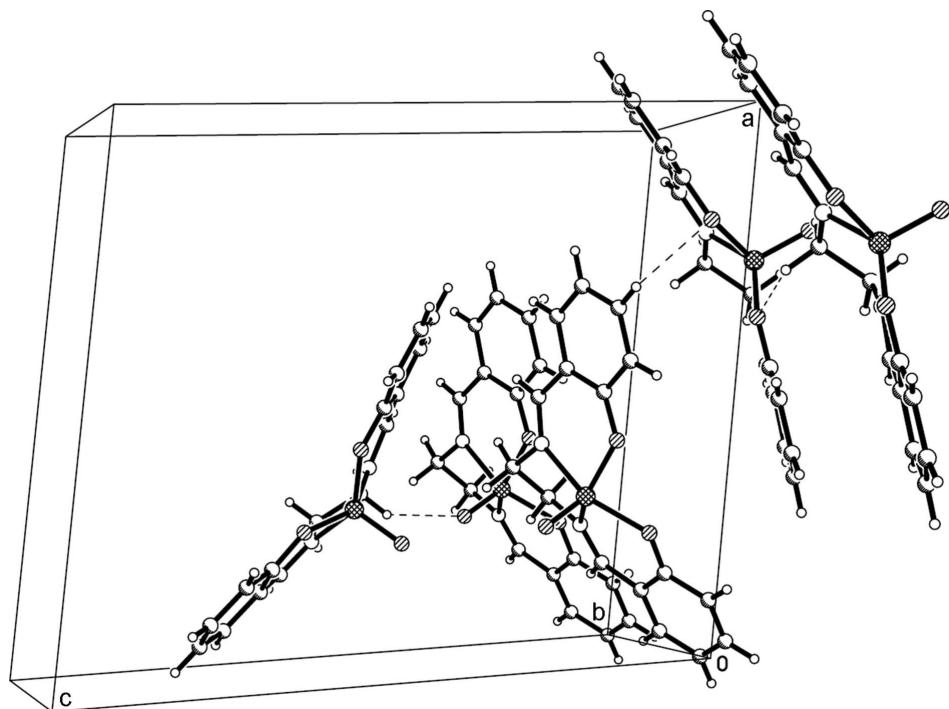

A mixture of $VOSO_4 \cdot 4H_2O$ (1.175 g, 5 mmol), $H_2\text{salen}$ (0.725 g, 5 mmol), triethylamine (0.20 mmol) and methanol (0.50 mol) in water was stirred for 1 h, and then heated at 413 K for 3 d in a sealed 25 ml Teflon-lined stainless steel vessel under autogenous pressure. After the reaction mixture was slowly cooled to room temperature at a rate of 5 K h^{-1} , black block crystals of the title compound were collected by filtration, washed with distilled water and dried in air.

S3. Refinement

H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 (aromatic), 0.97 Å (CH₂) and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

**Figure 1**

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
