## 8-Bromonaphthalen-1-amine

## Amy L. Fuller, Fergus R. Knight, Alexandra M. Z. Slawin* and J. Derek Woollins

Department of Chemistry, University of St Andrews, St Andrews KY16 9ST, Scotland Correspondence e-mail: amzs@st-and.ac.uk

Received 22 April 2008; accepted 29 April 2008
Key indicators: single-crystal X-ray study; $T=125 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.007 \AA$; $R$ factor $=0.052 ; w R$ factor $=0.117$; data-to-parameter ratio $=13.9$.

The title compound, $\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{BrN}$, was obtained by slow addition of sodium azide to 8 -bromo-1-naphthoic acid, followed by addition of aqueous ammonia. The crude product was crystallized from petroleum ether to give pink crystals. Compared to other 1,8-disubstituted naphthalene compounds, this compound exhibits less strain between the 1 and 8 substituents. Additionally, the NH protons form both intraand intermolecular hydrogen bonds. The naphthalene units are arranged in a herring-bone stacking motif.

## S1. Comment

Contrary to the formally bonded (and sterically strained) $\mathrm{S}-\mathrm{S}$ or $\mathrm{Te}-\mathrm{Te}$ atoms in positions 1 and 8 in previous naphthalene compounds (Aucott et al., 2004), the title compound $\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{BrN}$ exhibits a somewhat unstrained, intramolecular non-bonded $\mathrm{Br} 1 \cdots \mathrm{~N} 1$ distance of 3.070 (3) $\AA$. The molecular structure of the title compound is shown in Figure 1. An intramolecular hydrogen bonding interaction between the $\mathrm{N} 1-\mathrm{H} 1 \mathrm{a} \cdots \mathrm{Br} 1$ enables a close nonbonding $\mathrm{Br} 1 \cdots \mathrm{~N} 1$ distance and at the same time leaves the molecule relatively unstrained.
The other NH proton is involved in the intermolecular hydrogen bond (Table 1) N1—H1b $\cdots \mathrm{N} 1$ and forms an infinite zigzag chain. These chains have normal hydrophobic contact to each other (Figure 2). The naphthalene units are arranged in a herringbone stacking motif.

## S2. Experimental

The title compound was prepared by a method previously described (Herbert et al., 1987). Sodium azide ( $3.10 \mathrm{~g}, 0.048$ mol) was added over a 10 minute period to a stirred suspension of 8-bromo-1-naphthoic acid ( $2.0 \mathrm{~g}, 0.008 \mathrm{~mol}$ ) in concentrated sulfuric acid $(7 \mathrm{ml})$ and chloroform $(7 \mathrm{ml})$ at $45^{\circ} \mathrm{C}$. Each successive portion of sodium azide being added after the effervescence resulting from the previous addition had subsided. The mixture was stirred for 90 minutes at $45^{\circ} \mathrm{C}$ and added to water ( 140 ml ), and it was made alkaline with aqueous ammonia and extracted with chloroform ( $3 \times 140$ $\mathrm{ml})$. The combined extracts were dried with magnesium sulfate and evaporated to give the desired product. Yield 1.30 g ( $73 \%$ ). The black crude product was recrystallized from $60-80$ petroleum ether to give pink crystals.

## S3. Refinement

C 7 was refined subject to an ISOR constraint. All H atoms were included in calculated positions ( $\mathrm{C}-\mathrm{H}$ distances are $0.95 \AA, \mathrm{~N} — \mathrm{H}$ distances are $0.98 \AA$ ) and were refined as riding atoms with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}$ (parent carbon atom) The $\mathrm{N}-$ H protons were refined subject to a distance constraint but with a riding thermal parameter.
Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on F , with F set to zero for negative $\mathrm{F}^{2}$. The threshold expression of $\mathrm{F}^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

Figure 1
The structure of the title compound with labelled atoms and with displacement ellipsoids for non-H atoms drawn at the $50 \%$ probability level. The intramolecular hydrogen bond is indicated by a dashed line.

Figure 2
Packing diagram illustrating the intermolecular hydrogen bonding.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
