## Bis[(dimethyl- $\lambda^{4}$-sulfanylidene)oxonium] hexabromidotellurate(IV) dimethyl sulfoxide disolvate

Martin D. Rudd, ${ }^{\text {a* }}$ Gregory Kokke ${ }^{\text {a }}$ and Sergey V. Lindeman ${ }^{\text {b }}$<br>${ }^{\text {a }}$ University of Wisconsin-Fox Valley, Menasha, Wisconsin 54952, USA, and<br>${ }^{\mathbf{b}}$ Marquette University, Milwaukee, Wisconsin 53201, USA<br>Correspondence e-mail: martin.rudd@uwc.edu

Received 3 April 2008; accepted 22 May 2008
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{S}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.021 ; w R$ factor $=0.057$; data-to-parameter ratio $=13.3$.

The structure of the title salt, $2 \mathrm{C}_{2} \mathrm{H}_{7} \mathrm{OS}^{+} \cdot \mathrm{Br}_{6} \mathrm{Te}^{2-} \cdot 2 \mathrm{C}_{2} \mathrm{H}_{6} \mathrm{OS}$, displays $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonding between one protonated dimethyl sulfoxide molecule and a neighboring dimethyl sulfoxide molecule, and an octahedral geometry for the Te atom; the latter is situated on a center of inversion.

# Bis[(dimethyl- $\lambda^{4}$-sulfanylidene)oxonium] hexabromidotellurate(IV) dimethyl sulfoxide disolvate 

Martin D. Rudd, Gregory Kokke and Sergey V. Lindeman

## S1. Comment

The structure of (I) consists of two units of two $\mathrm{H}^{+}$hydrogen bonded dimethylsulfoxide molecules, Fig. 1, and a centrosymmetric hexabromotellurate(IV) anion, Fig. 2. At 2.448 (4) $\AA$, the $\mathrm{O} 1 \cdots \mathrm{O} 2$ distance is relatively short, and is consistent with the presence of a moderately strong hydrogen bond (Keefer et al., 1988). The IR spectrum reveals peaks typical for the $\left[(\mathrm{dmso})_{2} \mathrm{H}\right]^{+}$cation with a strong band at $731 \mathrm{~cm}^{-1}$. This is in line with similar samples in which the same cation has been analyzed (Jaswal et al., 1990). A closely related tellurium complex, $\left[(\mathrm{dmso})_{2} \mathrm{H}\right]_{2}\left[\mathrm{TeCl}_{6}\right]$ has been structurally reported at room temperature (Viossat et al., 1981) and at low temperature (Laitinen et al., 2002). The cation in the latter experiment shows a $\mathrm{O} 1 \cdots \mathrm{O} 2$ distance of 2.435 (3) $\AA$ and the authors describe this as a "relatively strong hydrogen bond".
The hexabromotellurate(IV) anion in (I) shows an approximately octahedral geometry as expected. A review of some related structures shows that there are packing factors that slightly distort the geometry. One example where $\left[\mathrm{TeBr}_{6}\right]^{2-}$ shows deviations away from the regular octahedral geometry indicates that there is a $0.024 \AA$ difference between the longest and shortest bond $\mathrm{Te}-\mathrm{Br}$ bond lengths (Borgias et al., 1985). In that report, the Te atom is located in a general position. In other literature, the Te is located at a center of inversion and displays a larger angular deviation from $90^{\circ}$ [87.56(3)-92.44 (3) ${ }^{\circ}$ (Abriel \& du Bois, 1989) which is greater than those reported here [less than $0.9^{\circ}$ away from $90^{\circ}$ ]. A review of structural data for $M X_{6} \mathrm{E}^{2-}$ compounds $(M=\mathrm{Se}, \mathrm{Te}$ and $X=\mathrm{Cl}, \mathrm{Br}, \mathrm{I})$ was published to provide an explanation of the stereochemistry of the lone pair electrons (Abriel, 1987).
The unit cell shows, Fig. 3, the pairs of hydrogen bonded dmso molecule and dmso-H ions and anions, Table 1.

## S2. Experimental

Compound (I) was prepared by the slow cooling to room temperature of a hot solution ( 333 K ) of tellurium dioxide ( 0.30 $\mathrm{g}, 0.19 \mathrm{mmol})$ dissolved in hydrobromic acid $(1 \mathrm{~mL})$ to which dimethylsulfoxide $(5 \mathrm{~mL})$ had been added. After 2 weeks, a crop of orange crystals formed although they are prone to solvent loss and decomposition. Analysis found: C 10.57; H 2.91; $\mathrm{C}_{8} \mathrm{H}_{26} \mathrm{Br}_{6} \mathrm{O}_{4} \mathrm{~S}_{4}$ Te requires: C 10.42, H 2.84. The IR spectrum showed strong bands at $3392,1056,731 \mathrm{~cm}^{-1}$.

## S3. Refinement

The maximum and minimum electron density peaks of 1.01 and -0.68 e $\AA^{-3}$, respectively, are located 0.88 and $1.53 \AA$, respectively, from the Te atom. Hydrogen atoms positions were refined freely with C-H = 0.83 (7) - 1.03 (6) $\AA$.

Figure 1
Numbering Scheme for $\left[(\mathrm{DMSO})_{2} \mathrm{H}\right]^{+}$(the hydrogen bond is shown as a dashed line). Displacement ellipsoids are shown at the $50 \%$ level.

Figure 2
Numbering Scheme for $\left[\mathrm{TeBr}_{6}\right]^{2-}$. Displacement ellipsoids are shown at the $50 \%$ level.

Figure 3
Hydrogen-bond formation and projection of the unit cell content of $\left[(\mathrm{DMSO})_{2} \mathrm{H}\right]_{2}\left[\mathrm{TeBr}_{6}\right]$. Symmetry operators: Te1A $[\mathrm{x}$, $\mathrm{y}+1, \mathrm{z}]$; O1A and O2A [1-x, 1-y, -z]; O1B and O2B $[\mathrm{x}, \mathrm{y}, \mathrm{z}+1]$

## Special details

Experimental. Analysis found: C 10.57; H 2.91; C $\sim 8 \sim \mathrm{H} \sim 26 \sim \mathrm{Br} \sim 6 \mathrm{O} \sim 4 \sim \mathrm{~S} \sim 4 \sim$ Te requires: C 10.42, H 2.84
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
