Received 8 May 2008; accepted 15 May 2008

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{O}-\mathrm{B})=0.002 \AA$; $R$ factor $=0.017 ; w R$ factor $=0.059$; data-to-parameter ratio $=9.2$.

Single crystals of the title compound, $\mathrm{Li}_{3} \mathrm{Sc}\left(\mathrm{BO}_{3}\right)_{2}$, have been obtained by spontaneous nucleation from a high-temperature melt. The title compound adopts a framework structure and is composed of distorted $\left[\mathrm{ScO}_{6}\right]$ octahedra, $\left[\mathrm{LiO}_{4}\right]$ tetrahedra, $\left[\mathrm{LiO}_{4}\right]$ rectangles and isolated $\left[\mathrm{BO}_{3}\right]$ triangles. Except for the Sc and one Li atom (both on inversion centres), all atoms are in general positions.

## S1. Comment

$\mathrm{Li}_{3} \mathrm{Sc}\left(\mathrm{BO}_{3}\right)_{2}$, (I), was found from analysis of phase equilibria in the system $\mathrm{Li}_{2} \mathrm{O}-\mathrm{Sc}_{2} \mathrm{O}_{3}-\mathrm{B}_{2} \mathrm{O}_{3}$, in which it is the first characterized pseudo-ternary phase. For the heavier Na homologue, two phases are already known, viz. $\mathrm{Na}_{3} \mathrm{Sc}_{2}\left(\mathrm{BO}_{3}\right)_{3}$ (Zhang et al., 2006) and $\mathrm{NaScB}_{2} \mathrm{O}_{5}$ (Becker \& Held, 2001).
The framework structure of $(\mathrm{I})$ is made up of distorted $\left[\mathrm{ScO}_{6}\right]$ octahedra, $\left[\mathrm{LiO}_{4}\right]$ tetrahedra, $\left[\mathrm{LiO}_{4}\right]$ rectangles and $\left[\mathrm{BO}_{3}\right]$ triangles as single building units. The $\left[\mathrm{ScO}_{6}\right]$ octahedra are linked via $\left[\mathrm{LiO}_{4}\right]$ rectangles by sharing edges to form columns parallel to [010]. The columns are linked to each other through $\left[\mathrm{LiO}_{4}\right]$ tetrahedra and $\left[\mathrm{BO}_{3}\right]$ triangles by sharing edges and corners (Figs 1 and 2).
The B atom is coordinated to three oxygen atoms forming nearly trigonal planar $\left[\mathrm{BO}_{3}\right]^{3-}$ anions. The $\mathrm{B}-\mathrm{O}$ bond lengths range from 1.376 (2) to 1.385 (2) $\AA$, and the $\mathrm{O} — \mathrm{~B} — \mathrm{O}$ angles are close to $120^{\circ}$ (Table 1), values that are typical for $\mathrm{BO}_{3}$ groups (Zobetz, 1982). The $\mathrm{Sc}^{3+}$ cation is coordinated by six oxygen atoms to form a distorted [ $\mathrm{ScO}_{6}$ ] ocahedron with Sc -O bond lengths ranging from 2.0854 (12) to 2.1197 (13) $\AA$. There are two crystallographically different Li atoms. One is situated on an inversion centre ( $\overline{1}$ symmetry) and is coordinated to four oxygen atoms forming a nearly planar [ $\mathrm{LiO}_{4}$ ] rectangle with $\mathrm{Li} 1 — \mathrm{O}$ bond lengths ranging from 2.0107 (12) to 2.1173 (12) $\AA$. The other Li atom is also coordinated to four O atoms, but is in the centre of a distorted tetrahedron with Li2-O bond lengths from 1.896 (3) to 2.137 (3) $\AA$ (Table 1). The average $\mathrm{Li}-\mathrm{O}$ bond length of the $\left[\mathrm{LilO}_{4}\right]$ rectangle $\left(2.064 \AA\right.$ ) is slightly longer than that of the $\left[\mathrm{Li2O}_{4}\right]$ tetrahedron (1.991 $\AA$ ).

## S2. Experimental

Single crystals of compound (I) were grown using a $\mathrm{LiBO}_{2}$-containing flux. The composition of the mixture for crystal growth was $4: 1: 4$ of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ (Sinopharm Reagents, $99.99 \%$ ), $\mathrm{Sc}_{2} \mathrm{O}_{3}$ (Sinopharm Reagents, 4 N ), and $\mathrm{B}_{2} \mathrm{O}_{3}$ (Sinopharm Reagents, $99 \%$ ). This mixture was heated in a platinum crucible to 1373 K , held at this temperature for several hours, and then cooled at a rate of $10 \mathrm{~K} / \mathrm{h}$ from 1373 to 873 K . The remaining flux attached to the crystals was readily dissolved in water. Crystals with an average size of 0.5 mm and mostly block shaped habit were obtained.

Figure 1
The structure of (I) in a projection approximatly along the [001] direction with displacement ellipsoids drawn at the $85 \%$ probability level.

Figure 2
The structure of (I) given in the polyhedral description. [ $\mathrm{ScO}_{6}$ ] octahedra are blue, $\left[\mathrm{LiO}_{4}\right]$ tetrahedra are green, $\left[\mathrm{LiO}_{4}\right]$ rectangles are purple, and $\left[\mathrm{BO}_{3}\right]$ units are yellow.

$\Delta \rho_{\text {min }}=-0.23$ e $\AA^{-3}$
Extinction correction: SHELXL97 (Sheldrick, 2008)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
