Received 16 June 2008; accepted 17 June 2008

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.055 ; w R$ factor $=0.174 ;$ data-to-parameter ratio $=14.2$.

The title compound, $\mathrm{C}_{8} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{4}$, is a Weinreb amide that is also an important intermediate for the preparation of ketones and aldehydes. The molecule possesses a centre of symmetry.

## S1. Comment

The Weinreb amides are widely recognized as effective acylating agents since they react with organometallics (RM, $M=$ $\mathrm{MgBr}, \mathrm{Li})$ to produce ketones without side products in organic synthesis, including the total synthesis of complex natural products (Nahm \& Weinreb, 1981). We here reported the structure of the Weinreb amides related title compound, (I).
Compound (I), is the synthetic intermediate, whose molecule is the centrosymmetric structure (Fig.1). In the symmetric unit, the $\mathrm{C} 1-\mathrm{O} 1$ bond distance is 1.224 (2) $\AA$, which displays a typical double-bond of ketone carbonyl. Whereas, the $\mathrm{N} 1-\mathrm{C} 1$ bond distance of 1.342 (2) $\AA$ is obviously shorter than $\mathrm{N} 1 — \mathrm{C} 4$ of 1.445 (2) $\AA$, indicates that amide bond N1— C 1 has some proporties of double-bond.

## S2. Experimental

Triethylamine ( $25 \mathrm{ml}, 180 \mathrm{mmol}$ ) was added slowly by cannulation to a stirred suspension of $N, O$-dimethylhydroxylamine $(9.0 \mathrm{~g}, 92.25 \mathrm{mmol})$ and succinyl chloride $(100 \mathrm{ml})$ in dichloromethane at 273 K under $\mathrm{N}_{2}$. After stirring for 2 h the solution was allowed to warm to room temperature and quenched with saturated aqueous sodium bicarbonate solution ( 50 ml ). The layers were separated and the aqueous layer was extracted with dichloromethane ( $2 \times 25 \mathrm{ml}$ ). The combined organic extracts were washed with brine $(18.5 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure to give the compound (I) (7.365 g, 83\%) as light brown needles. The molecule formula, $\mathrm{C}_{8} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{4}$ was established by EIMS $\mathrm{m} / z: 144\left(M+-\mathrm{N}\left(\mathrm{CH}_{3}\right) \mathrm{OCH}_{3}\right)$. Spectroscopic analysis, ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3}-\mathrm{d}_{6}$ ) $\delta: 3.75\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.19(6 \mathrm{H}$, s , $\left.\mathrm{NCH}_{3}\right)$ and $2.78\left(4 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( $\left.400 \mathrm{MHz} ; \mathrm{CDCl}_{3}-\mathrm{d}_{6}\right) \delta: 173.8(\mathrm{C}=\mathrm{O}), 61.6\left(\mathrm{OCH}_{3}\right), 32.6$ and 26.8.

## S3. Refinement

H atoms were treated as riding, with $\mathrm{C}-\mathrm{H}$ distances in the range of $0.96-0.97 \AA$, and were refined as riding with $U_{\text {iso }}(H)$ $=1.2 U_{\mathrm{eq}}\left(\mathrm{C}_{\text {methylene }}\right)$ and $U_{\mathrm{iso}}(H)=1.5 U_{\mathrm{eq}}\left(\mathrm{C}_{\text {methyl }}\right)$.

## Figure 1

The molecular structure of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50\% probability level.

Hydrogen site location: inferred from
$\quad$ neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.117 P)^{2}+0.1547 P\right]$
where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\max }=0.25$ e $\AA^{-3}$
$\Delta \rho_{\min }=-0.24 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
