# cis-Aquadichlorido[pyrimidin-2(1H)-one$\left.\boldsymbol{\kappa} N^{3}\right] \operatorname{copper}($ II) 

Mukhtar A. Kurawa, Christopher J. Adams and A. Guy Orpen*

School of Chemistry, University of Bristol, Bristol BS8 1TS, England
Correspondence e-mail: guy.orpen@bristol.ac.uk

Received 9 June 2008; accepted 20 June 2008

Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.008 \AA$; $R$ factor $=0.034 ; w R$ factor $=0.099$; data-to-parameter ratio $=17.6$.

In the title compound, $\left[\mathrm{CuCl}_{2}\left(\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{~N}_{2} \mathrm{O}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)\right]$, the $\mathrm{Cu}^{\text {II }}$ cation is coordinated by two chloride anions, one pyrimidin-2one N atom and one water molecule, giving a slightly distorted square-planar geometry. In the crystal structure, the pyri-midin-2-one rings stack along the $b$ axis, with an interplanar distance of $3.306 \AA$, as do the copper coordination planes (interplanar spacing $=2.998 \AA$ ). The coordination around the Jahn-Teller-distorted $\mathrm{Cu}^{\text {II }}$ ion is completed by long $\mathrm{Cu} \cdots \mathrm{O}$ $[3.014(5) \AA$ ] and $\mathrm{Cu} \cdots \mathrm{Cl}$ [3.0194 (15) Å] interactions with adjacent molecules involved in this stacking. Several $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{Cl}, \mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ intermolecular hydrogen bonds form a polar three-dimensional network.

## Related literature

A similar coordination environment and geometry about the copper atom was described by Crass et al. (1996) for $\left[\mathrm{Cu}\left(\mathrm{C}_{12} \mathrm{H}_{18} \mathrm{~N}_{4}\right) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$.

## cis-Aquadichlorido[pyrimidin-2(1H)-one- $\kappa N^{3}$ ]copper(II)

Mukhtar A. Kurawa, Christopher J. Adams and A. Guy Orpen

## S1. Comment

Mechanochemistry is a technique currently attracting increasing interest, in part because of its potential to offer an environmentally friendly and sustainable means for solid state synthesis. We sought to broaden the scope of this still relatively under-utilized technique by reacting $\mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ and 2-hydroxypyrimidine hydrochloride under mechanochemical conditions to synthesize $\left[\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{~N}_{2} \mathrm{O}\right]_{2}\left[\mathrm{CuCl}_{4}\right]$. However, the title compound $\mathbf{I}$ was obtained instead, and crystal structure determination at 100 (2) K revealed a square planar molecule in the polar space group Pn. Crass et al. (1996) reported the structure of a related compound $\left[\mathrm{Cu}\left(\mathrm{C}_{12} \mathrm{H}_{18} \mathrm{~N}_{4}\right) \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$ with a similar type of coordination environment at copper but a different hydrogen bonding network.

## S2. Experimental

$\mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ and 2-hydroxypyrimidine hydrochloride in a 1:2 molar ratio were ground in an agate mortar. The resulting powder was dissolved in acetonitrile and the solution left to evaporate slowly at room temperature. Green, needle-like crystals of the title compound were obtained after a few days.

## S3. Refinement

H atoms bonded to O atom were located in the difference map and refined with distance restraints of $\mathrm{O}-\mathrm{H}=0.84$ (2) $\AA$ with $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{O})$. Other H atoms were positioned geometrically and refined using a riding model, with $\mathrm{C}-\mathrm{H}=$ $0.93 \AA$ and $\mathrm{N}-\mathrm{H}=0.86 \AA$, with $U_{\text {iso }}(\mathrm{H})=1.2$ times $U_{\text {eq }}(\mathrm{C}, \mathrm{N})$.

## Special details

Experimental. CrysAlis RED, Oxford Diffraction Ltd., Version 1.171.32.5 Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
