## 5-Amino-2,4,6-triiodoisophthalic acid monohydrate

## Tobias Beck* and George M. Sheldrick

Department of Structural Chemistry, Georg-August Universität, Tammannstrasse 4, 37077 Göttingen, Germany
Correspondence e-mail: tbeck@shelx.uni-ac.gwdg.de

Received 22 May 2008; accepted 11 June 2008
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.007 \AA$;
$R$ factor $=0.026 ; w R$ factor $=0.062$; data-to-parameter ratio $=15.7$.

The title compound, $\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{I}_{3} \mathrm{NO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$, shows an extensive hydrogen-bond network; in the crystal structure, molecules are linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}, \mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds involving all possible donors and also the water molecule.

## 5-Amino-2,4,6-triiodoisophthalic acid monohydrate

Tobias Beck and George M. Sheldrick

## S1. Comment

Iodine-based compounds have always been in the focus of contrast agents for X-ray imaging. The 1,3,5-triiodobenzene core has been the basis of many contrast agents (Yu \& Watson 1999). The ionic monomer diatrizoate was one of the first compounds used (Tonnessen et al. 1996).
The title compound, 5-Amino-2,4,6-triiodoisophthalic acid (hereafter I3C), crystallizes as a monohydrate, due to water impurities in the crystallization solution. It forms hydrogen bonds with all potential donors as well as the lattice water being involved (Fig. 2, Table 1). However, the interaction between N13 and O12 is slightly weaker. In the crystal, the molecules are positioned perpendicular to each other, showing no $\pi-\pi$ interactions of the phenyl rings (Fig. 3).
The three functional groups for hydrogen bonding, along with the three iodine atoms, render I3C a suitable agent for experimental phasing of macromolecules (Beck et al., unpublished results). The iodine atoms give rise to a large anomalous signal, even at in-house sources. Additionally, they form an equilateral triangle (I-I $6.0 \AA$ ) which is easy to recognize in the heavy atom substructure when this compound is used as a heavy atom derivative for macromolecular phasing.

## S2. Experimental

The title compound was prepared according to the reported procedure (Larsen et al. 1956). It was recrystallized from a methanol-acetonitrile solution by slowly evaporating the solvents to obtain crystals suitable for X-ray single-crystal diffraction.

## S3. Refinement

Hydrogen atoms were located via the difference Fourier map and their geometrical positions were refined with restraints. The $U$ values were set to $1.5 U_{\mathrm{eq}}$ of their parent atom. Bond lengths for hydrogen atoms were restrained to be equal (SADI in SHELXL-97). Phenyl ring and carboxylate groups were restrained to planarity.

Figure 1
A view of I3C. Displacement ellipsoids are drawn at the $50 \%$ probability level. The hydrogen bond within the asymmetric unit is shown as a dashed line.

Figure 2
Hydrogen bonding of I3C. Symmetry equivalents are depicted in orange.

Figure 3
Packing of I3C, viewed along b. Hydrogen atoms are omitted for clarity. In alternating layers molecules are positioned perpendicular to each other. Hydrogen bonds are shown as dashed lines.

Figure 4
Synthetic scheme of I3C.

$w=1 /\left[\sigma^{2}\left(F_{0}{ }^{2}\right)+(0.0277 P)^{2}+17.3624 P\right]$
where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}=0.002$
$\Delta \rho_{\text {max }}=0.72 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-1.71 \mathrm{e}^{-3}$
Extinction correction: SHELXL97 (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$

Extinction coefficient: 0.000058 (8)

## Special details

Experimental. Intensities were measured with a Bruker SMART 6000 area-detector
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
Hydrogen atoms were located via the difference Fourier map and their geometrical positions were refined with restraints. The $U$ values were set to $1.5 U_{\text {eq }}$ of their parent atom.
