Received 25 June 2008; accepted 3 July 2008

Key indicators: single-crystal X-ray study; $T = 291$ K; mean $\sigma(C-C) = 0.004$ Å; R factor = 0.034; wR factor = 0.103; data-to-parameter ratio = 13.9.

In the title compound, $[Cu(C_7H_3Cl_2O_2)_2]_n$, the Cu^{II} atom lies on a centre of inversion and adopts a $[4+2]$ coordination mode, with two long axial $Cu-Cl$ coordinative bonds complementing four $Cu-O$ bonds from two 2,4-dichloro-6-formylphenolate ligands in a distorted square plane. $\pi-\pi$ stacking interactions are also formed between neighbouring aromatic rings, with a centroid-centroid separation of 3.624 (2) Å.

S1. Comment

The design and synthesis of derivatives of salicylaldehyde and their metal complexes are fascinating areas of research, which can be used in a variety of studies such as drug design, life science, catalysis, and so on (Harkat *et al.*, 2008; Duan *et al.*, 2007). In our previous studies, we have reported the X-ray single-crystal structures of 3,5-dichloro-2-hydroxybenzaldehyde and 3,5-dibromo-2-hydroxybenzaldehyde (Fan *et al.*, 2008*a, b*). In this paper, we report the X-ray single-crystal structure of the title Cu^{II} complex.

In the title compound (Fig. 1), the coordination geometry of the central Cu^{II} ion can be described as [4 + 2]. Four Cu—O bonds from two 3,5-dichloro-2-hydroxybenzaldehyde anions constitute a distorted square coordination plane with the bond lengths varying from 1.906 (2) to 1.943 (2) Å (Table 1), which are in good agreement with those found in similar Cu^{II} complexes (Sun & Gao, 2005; Zhang *et al.*, 2006). Two adjacent Cl atoms from two 3,5-dichloro-2-hydroxybenzaldehyde anions (Cl2, symmetry codes: 1 + *x*, *y*, *z* and 1 - *x*, 2 - *y*, 1 - *z*) occupy two axial positions by weak coordinative bonds with the same Cu—Cl bond length of 3.207 (1) Å (Fig. 2). In addition, these molecules are further stabilized by π - π stacking interactions with the centroid-to-centroid separation of 3.624 (2) Å, forming one-dimensional chain motifs (Fig. 2). A dihedral angle of 45.3 (1) ° is formed between the planes of molecules in neighbouring chains.

S2. Experimental

A solution of Cu(OAc)₂·H₂O (0.1 mmol, 0.020 g) in methanol (5 ml) was added to a methanol solution (20 ml) of 3,5-dichloro-2-hydroxybenzaldehyde (0.2 mmol, 0.039 g). The resulting mixture was refluxed for 2 h, cooled and evaporated slowly at room temperature in air to give dark red single crystals suitable for X-ray diffraction measurement. Analysis calculated for C₁₄H₆O₄Cl₂Cu: C, 37.91. H, 1.36%; found: C, 37.85; H, 1.59%.

FT—IR (KBr pellets, cm⁻¹): 3058 (*m*), 1605 (*vs*), 1510 (*s*), 1438 (*s*), 1420 (*s*), 1337 (*s*), 1217 (*s*), 1162 (*s*), 887 (*m*), 766 (*s*), 720 (*m*), 600 (*m*) and 455 (*m*).

S3. Refinement

H atoms bonded to C atoms were placed in geometrically idealized positions (C—H = 0.93 Å) and refined as riding atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figure 1

Molecular structure showing displacement ellipsoids at the 30% probability level for non-H atoms. Cu1 lies on a centre of inversion: unlabelled atoms are related to labelled atoms by the symmetry code $2-x, 2-y, 1-z$.

Figure 2

A perspective view of one chain motif, showing long Cu—Cl coordinative bonds and π – π stacking interactions (dashed lines).

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.033$	H-atom parameters constrained
$wR(F^2) = 0.103$	$w = 1/[\sigma^2(F_o^2) + (0.0631P)^2 + 0.6132P]$
$S = 1.06$	where $P = (F_o^2 + 2F_c^2)/3$
1471 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
106 parameters	$\Delta\rho_{\text{max}} = 0.41 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.83 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
