Received 11 June 2008; accepted 31 July 2008

Key indicators: single-crystal X-ray study;  $T = 113$  K; mean  $\sigma(C-C) = 0.003$  Å;  $R$  factor = 0.024;  $wR$  factor = 0.066; data-to-parameter ratio = 16.7.

The title complex,  $[Zn_3(C_2H_3O_2)_6(C_9H_8ClN_3)_2]$ , contains three  $Zn^{II}$  atoms bridged by six acetate ligands. The central  $Zn^{II}$  ion, located on an inversion centre, is surrounded by six O atoms from acetate ligands in a distorted octahedral geometry [ $Zn-O = 1.9588$  (12)–2.1237 (12) Å]. The terminal  $Zn^{II}$  ions are coordinated by one N atom of 2-amino-7-chloro-5-methyl-1,8-naphthyridine and three O atoms of three acetate ligands in a distorted tetrahedral geometry. The separation between the central and terminal  $Zn^{II}$  ions is 3.245 (3) Å.

### **S1. Comment**

Acetic acid is versatile ligand which can function in monodentate or bidentate modes in metal complexes (Baker & Norman, 2004; Lis *et al.*, 2005; Stadie *et al.*, 2007). Here, we report the crystal structure of the title compound, (I), in which three Zn<sup>II</sup> ions are bridged by three acetic acid ligands.

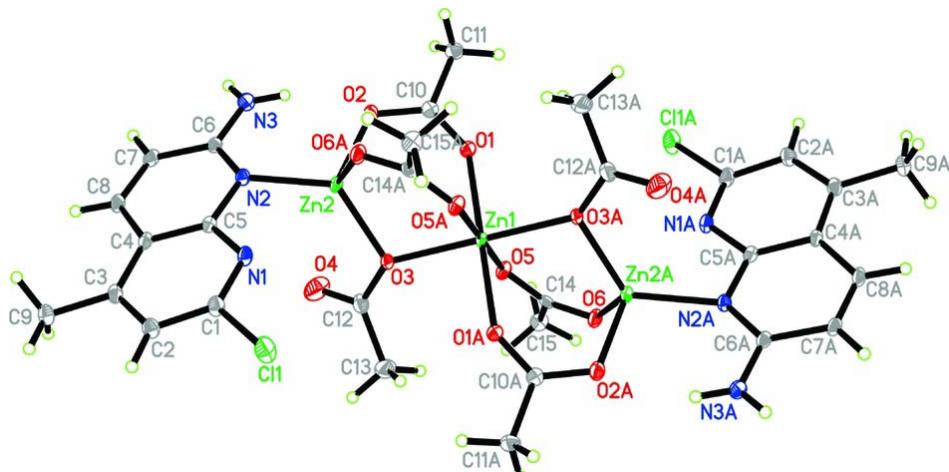

The middle Zn atom in (I) (Fig. 1) has a distorted octahedral coordination geometry involving six O atoms of six acetic acid ligands. The Zn—O bonds lengths are between 1.9588 (12) and 2.1237 (12) Å (Table 1). The End Zn<sup>II</sup> ion is coordinated by one N atom of 2-amino-4-methyl-7-chloro-1,8-naphthyridine and three O atoms of three acetic acid ligands, and has a distorted tetrahedron coordination geometry. The distance of two neighboring Zn<sup>II</sup> ions separated by two O atoms of each two acetate bridging ligands and one O atoms of one acetate bridging ligand is 3.245 (3) Å.

### **S2. Experimental**

A 10 ml dichloromethane solution of 2-amino-5-methyl-7-chloro-1,8-naphthyridine (0.039 g, 0.2 mmol) was added to a 20 mL dichloromethane solution of Zn(CH<sub>3</sub>COO)<sub>2</sub> (0.055 g, 0.3 mmol) under an N<sub>2</sub> atmosphere. The mixture was stirred for 10 h. Colorless crystals suitable for X-ray diffraction were formed by vapour diffusion of diethyl ethyl ether into dichloromethane solution.

### **S3. Refinement**

All hydrogen atoms were generated geometrically (C—H bond lengths of methyl group fixed at 0.98 Å, C—H bond lengths of naphthyridine fixed at 0.95 Å), assigned appropriated isotropic thermal parameters,  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

**Figure 1**

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
