Received 20 August 2008; accepted 11 September 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.005$ Å; R factor = 0.019; wR factor = 0.050; data-to-parameter ratio = 11.4.

In the hydrothermally synthesized title compound, $[Ce(C_5H_3N_2O_2)(C_2O_4)(H_2O)_2]_n$, the Ce^{III} ion is coordinated by four O atoms from two different oxalate ligands, three O atoms from two symmetry-related pyrazine-2-carboxylate ligands, two O atoms from two water molecules and one N atom from a pyrazine-2-carboxylate ligand in a distorted bicapped square-antiprismatic coordination geometry. The oxalate and pyrazine-2-carboxylate ligands bridge the Ce^{III} ions, forming a two-dimensional structure. In addition, intermolecular O—H···O and O—H···N hydrogen bonds connect the two-dimensional structure into a three-dimensional network.

S1. Comment

Rare metal coordination polymers of one-, two- and three-dimensional extended frameworks are an attractive research area because of the diverse structures available (Zheng, 2002; Eliseeva *et al.*, 2004). Pyrazine-2,3-dicarboxylic acid is a good ligand with a versatile coordination mode, which is widely used in self-assembled polymeric coordination synthesis (Zou *et al.*, 1999; Wang *et al.*, 2007). The title compound, $[Ce(C_5H_3N_2O_2)(C_2O_4)(H_2O)_2]_n$, was obtained unintentionally as the harvested product of the hydrothermal reaction of pyrazine-2,3-dicarboxylic acid and $Ce_2(C_2O_4)_3 \cdot 10H_2O$. We report here the crystal structure of the title compound, a 2-D polymeric structure consisting of pyrazine-2-dicarboxylate and oxalate ligands.

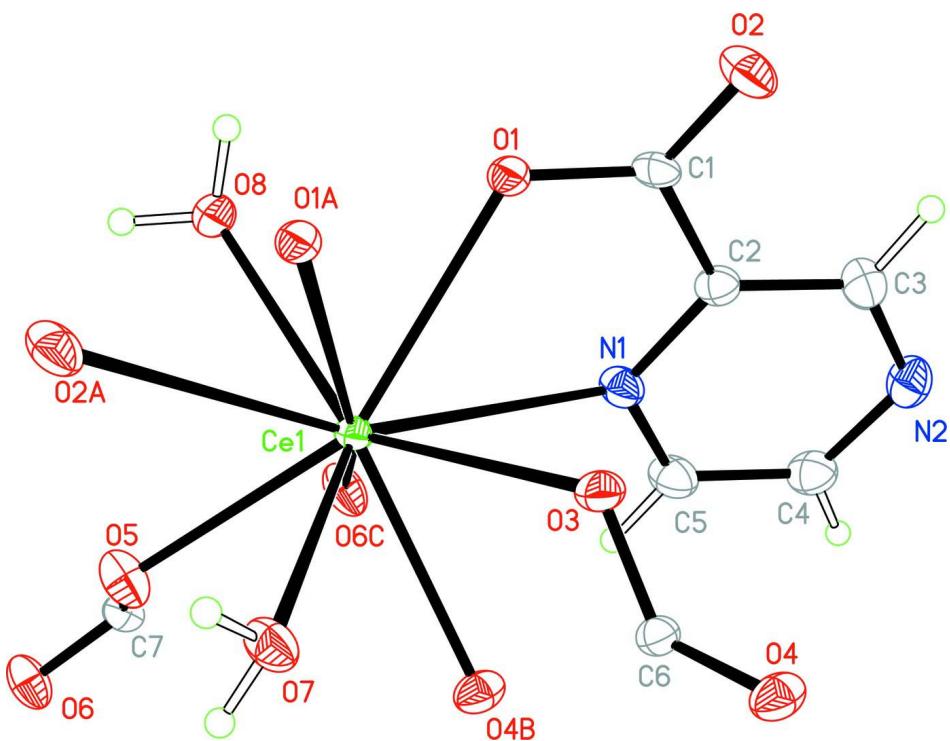

The coordination environment of the Ce^{III} ion can be described as a distorted bicapped square-antiprism, in which the Ce^{III} ion is ten-coordinated by four oxygen atoms from two different oxalate ligands, three oxygen atoms from two different pyrazine-2-carboxylic acid ligands, two oxygen atoms from two water molecules, and one nitrogen atom from a pyrazine-2-carboxylate ligand, as shown in the Fig. 1. The oxalate ligands and pyrazine-2-carboxylate ligands bridge Ce^{III} ions to form a two-dimensional structure. The $Ce—O$ bond lengths range from 2.506 (2) to 2.897 (3) Å. In the crystal structure, intermolecular $O—H\cdots O$ and $O—H\cdots N$ hydrogen bonds connect the two-dimensional structure into a three-dimensional network.

S2. Experimental

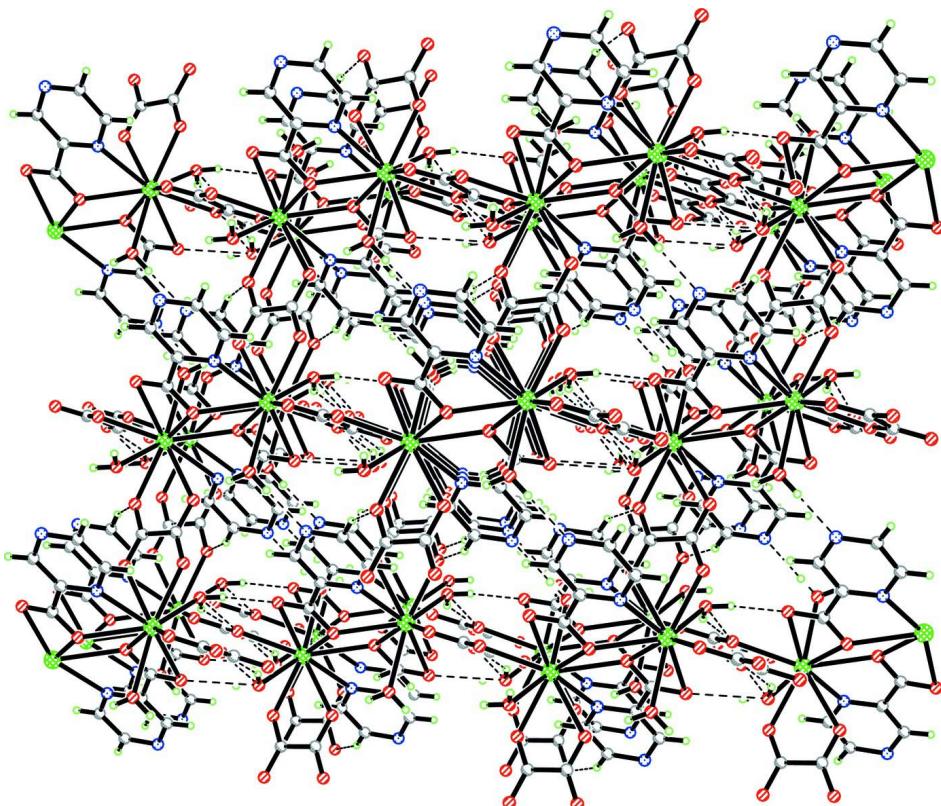

Colorless block-shaped crystals of the title compound were obtained by a hydrothermal reaction of $Ce_2(C_2O_4)_3 \cdot 10H_2O$ (0.10 mmol, 0.0710 g), pyrazine-2,3-dicarboxylic acid (0.10 mmol, 0.0168 g) and deionized water (15 ml) in a 23 ml teflon-lined reaction vessel at 423 K for 120 h followed by slow cooling to room temperature (yield 77% based on initial input of pyrazine-2,3-dicarboxylic acid).

S3. Refinement

H atoms were included in calculated positions and refined in a riding-model approximation with $O—H = 0.85$ Å, $C—H = 0.93$ Å and $U_{iso}(H) = 1.2U_{eq}(C,O)$.

**Figure 1**

The asymmetric unit of the title compound with symmetry related atoms included to show the coordination environment of Ce1. Displacement ellipsoids are drawn at the 40% probability level [Symmetry codes: (A) $-x + 1, -y + 2, -z + 3$, (B) $-x + 1, -y + 2, -z + 3$, (C) $-x, -y + 1, -z + 2$].

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
