## Methylene bis(dithiobenzoate)

Yao-Ren Liang, ${ }^{\text {a }}$ Hung-Chun Tong, ${ }^{\text {a }}$ Yih-Hsing Lo, ${ }^{\text {a* }}$ Chia-Her Lin ${ }^{\text {b }}$ and Ting Shen Kuo ${ }^{\text {c }}$<br>${ }^{\text {a }}$ Department of Chemical Engineering, Tatung University, Taipei 104, Taiwan,<br>${ }^{\text {b }}$ Department of Chemistry, Chung-Yuan Christian University, Chung-Li 320, Taiwan, and ${ }^{\text {c }}$ Department of Chemistry, National Normal Taiwan University, Taipei 106, Taiwan<br>Correspondence e-mail: yhlo@ttu.edu.tw

Received 14 October 2008; accepted 11 November 2008
Key indicators: single-crystal X-ray study; $T=200 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.009 \AA$; $R$ factor $=0.056 ; w R$ factor $=0.157$; data-to-parameter ratio $=15.1$.

In the title compound, $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{~S}_{4}$, two phenyldithiocarboxylate units are linked through a methylene C atom on a twofold rotation axis. The central $\mathrm{S}-\mathrm{CH}_{2}-\mathrm{S}$ angle of 116.9 (5) ${ }^{\circ}$ is significantly larger than the ideal tetrahedral value. The dihedral angle formed by the two phenyl rings is $68.2(1)^{\circ}$. The refined Flack parameter of 0.2 (3) does not permit unambiguous determination of the absolute structure.

## S1. Comment

During studies on the reactivity of the $\mathrm{RuS}_{2}$ complex $\left\{\mathrm{Ru}(\mathrm{Tp})\left(\mathrm{PPh}_{3}\right)\left[\mathrm{S}_{2} \mathrm{CC}_{6} \mathrm{H}_{5}\right]\right\}$, (hydridotripyrazol-1-ylborato$\left.\kappa^{3} N^{2}, N^{2^{\prime \prime}}, N^{2 \prime \prime}\right)\left(\right.$ phenyldithiocarboxylato- $\left.\kappa^{2} S, S^{\prime}\right)$ (triphenylphosphine- $\kappa P$ )ruthenium, with $\mathrm{CH}_{3} \mathrm{CN}$ in dichloromethane, we unexpectedly obtained crystals of the title compound. It consists of two phenyldithiocarboxylate units bridged by a methylene group. The ${ }^{1} \mathrm{H}$ NMR spectrum in $\mathrm{CDCl}_{3}$ shows one singlet at 5.31 ppm , assignable to $\mathrm{SCH}_{2} \mathrm{~S}$. The EI mass spectrum shows the molecular ion $\left[\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{~S}_{4}\right]^{+}$with the characteristic isotopic distribution patterns. In the crystal, the C 2 —S2 bond length of 1.643 (6) $\AA$ is slightly longer than expected for a $\mathrm{C}=\mathrm{S}$ double bond (ca $1.61 \AA$ ), while the $\mathrm{C} 2 — \mathrm{~S} 1$ and $\mathrm{C} 1 —$ S1 distances of 1.743 (6) and 1.794 (5) $\AA$, respectively, are clearly single bonds. The $\mathrm{S}-\mathrm{C}-\mathrm{S}$ angle of $116.9(5)^{\circ}$ is larger than the ideal tetrahedral value, probably due to repulsion between the $\mathrm{CS}_{2}$ groups.

## S2. Experimental

The title compound was obtained unexpectedly during studies on the reactivity of $\left\{\mathrm{Ru}(\mathrm{Tp})\left(\mathrm{PPh}_{3}\right)\left[\mathrm{S}_{2} \mathrm{CC}_{6} \mathrm{H}_{5}\right]\right\}$ with $\mathrm{CH}_{3} \mathrm{CN}$ in dichloromethane. To a solution of $\left\{\mathrm{Ru}(\mathrm{Tp})\left(\mathrm{PPh}_{3}\right)\left[\mathrm{S}_{2} \mathrm{CC}_{6} \mathrm{H}_{5}\right]\right\}(2.00 \mathrm{~g}, 2.73 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{ml})$, an excess of $\mathrm{CH}_{3} \mathrm{CN}(2 \mathrm{ml})$ was added. The resulting yellow solution was heated to reflux for 3 h and the yellow precipitate obtained was filtered and washed with methanol and water to remove excess reagents. The compound was then dried under vacuum to give $0.83 \mathrm{~g}(91 \%$ yield $)$. Crystals for X-ray structure analysis were obtained by recrystallization of the crude product from dichloromethane-hexane.
Elemental analysis calculated: C, 56.21 ; $\mathrm{H}, 3.77 \%$; found: C, 56.19 ; $\mathrm{H}, 3.69 \% .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 303 \mathrm{~K}, \mathrm{ppm}\right): \delta 7.98-$ $7.35(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ph}), 5.31\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) . \mathrm{MS}(\mathrm{m} / \mathrm{z}): 320.5\left(M^{+}\right)$.

## S3. Refinement

H atoms were placed in idealized positions and constrained to ride on their parent atoms, with $\mathrm{C}-\mathrm{H}=0.95-0.96 \AA$ and $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$. The refined Flack parameter of $0.2(3)$ does not permit unambiguous determination of the absolute structure.

## Figure 1

Molecular structure of the title compound showing displacement ellipsoids at the $50 \%$ probability level for non-H atoms.
Non-labelled atoms are related to labelled atoms by the symmetry code 1-x, 2-y,z.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.056$
$w R\left(F^{2}\right)=0.157$
$S=1.13$
1317 reflections
87 parameters
0 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{0}{ }^{2}\right)+(0.0733 P)^{2}\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=0.37$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.46$ e $\AA^{-3}$
Absolute structure: Flack (1983), 505 Friedel pairs
Absolute structure parameter: 0.2 (3)

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
