## Ethyl 5-amino-3-methylsulfanyl-1H-pyra-zole-4-carboxylate

Yan Li, Teng-Fei Shao and Jian-Wu Wang*

School of Chemistry and Chemical Engineering, Shandong University, Jinan 250100, People's Republic of China
Correspondence e-mail: yugp2005@yahoo.com.cn

Received 27 October 2008; accepted 28 October 2008
Key indicators: single-crystal X-ray study; $T=273 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.044 ; w R$ factor $=0.127$; data-to-parameter ratio $=13.8$.

In the title compound, $\mathrm{C}_{7} \mathrm{H}_{11} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}$, bond lengths and angles are within normal ranges. The crystal packing is stabilized by intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, linking the molecules into infinite one-dimensional chains along the $a$ axis.

## Ethyl 5-amino-3-methylsulfanyl-1 H-pyrazole-4-carboxylate

Yan Li, Teng-Fei Shao and Jian-Wu Wang

## S1. Comment

The title compound, is an important intermediate in synthesis of heterocyclic compounds (Hanfeld et al., 1996) in particular, in producing imidazo[1,2-b]pyrazole derivatives. Here, we report the crystal structure of (I).
In compound (I), all bond lengths and angles are normal and in a good agreement with those reported previously (Ren et al., 2004). The pyrazole ring C4/C5/C5/N2/N3 and bonded atoms N1, S1, C3, O1, C2 and C1 are coplanar, the largest deviation from the mean plane being 0.053 (2) $\AA$ for atom C3. The crystal packing is stabilized by intermolecular N$\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, linking the molecules into infinite one-dimensional chain along the $a$ axis.

## S2. Experimental

A round-bottomed flask fitted with a dropping funnel was charged with $11.2 \mathrm{~g}(0.2 \mathrm{~mol})$ potassium hydroxide in 200 ml MeCN . The solution was cooled in an ice bath. Through the dropping funnel $22.7 \mathrm{~g}(0.2 \mathrm{~mol})$ ethyl cyanoacetate was added gradually. After stirring at 273 K for $0.5 \mathrm{~h}, 15.2 \mathrm{~g}(0.2 \mathrm{~mol})$ carbon bisulfide was added while vigorous stirring. Keep stirring for $1 \mathrm{~h}, 50.4 \mathrm{~g}(0.4 \mathrm{~mol})$ dimethyl sulfate was added through the drop funnel, then left overnight. The reaction mixture was filtered and filtrate evaporated on a rotary evaporator to remove the solvent. The mixture was dissolved in 50 ml ethanol, then through a drop funnel $12.5 \mathrm{~g}(0.2 \mathrm{~mol})$ of hydrazine hydrate was added. The solution was evaporated in vacuo to afford crude product, which was purified by column chromatography to give the desired product 34.7 g , yield $86.3 \%$. Crystals suitable for X-ray diffraction analysis were obtained by slow evaporation of a methanol solution at room temperature for one week.

## S3. Refinement

All H atoms were placed in calculated positions, with $\mathrm{C}-\mathrm{H}=0.93$ or $0.97 \AA, \mathrm{~N}-\mathrm{H}=0.86 \AA$, and included in the final cycles of refinement using a riding model, with $U_{\mathrm{iso}}(\mathrm{H})=1.2\left(1.5\right.$ times for methyl) times $U_{\text {eq }}(\mathrm{C}, N)$.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
