Received 5 January 2009; accepted 14 January 2009

 Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.027; wR factor = 0.070; data-to-parameter ratio = 14.8.

In the title compound, $[CoCl_2(C_{10}H_8N_2S)_2]_n$, the Co^{II} atom is located on an inversion centre and is six-coordinated by four N atoms of four symmetry-related di-4-pyridyl sulfide ligands, and two Cl atoms in *trans* positions, in a distorted octahedral geometry. The bridging bidentate di-4-pyridyl sulfide ligands link the Co^{II} centres into a three-dimensional network. The four coordinating pyridine groups are donors and acceptors (N atoms) for intramolecular $C-H \cdots N$ and $C-H \cdots Cl$ hydrogen bonds.

Poly[dichloridobis(μ_2 -di-4-pyridyl sulfide- κ^2N,N')cobalt(II)]**Jian-Ge Wang, Jian-Hua Qin and Gui-Ying Zhang****S1. Comment**

As well known, di-4-pyridyl sulfide possesses a magic angle (C-S-C, $\sim 100^\circ$) and conformational nonrigidity so it has some flexibility compared with other linear rigid ligands such as simple 4, 4'-bipyridine analogues. A number of metal complexes derived from di-4-pyridyl sulfide have been reported previously, such as the silver(I) complexes (Jung *et al.*, 1999), copper(II) complexes (Muthu *et al.*, 2005), nickel(II) complex (Kondo *et al.*, 2004), as well as the cobalt(II) complex that showing 2-fold interpenetrating structures (Jung *et al.*, 1998).

As shown in Fig. 1, the local geometry of the cobalt atoms is a distorted octahedral arrangement with two chlorine atoms in trans positions and four pyridine units in a propeller arrangement (Tab. 1). Each di-4-pyridyl sulfide ligand connects two cobalt(II) ions defining the edges of a 40-membered [Co(II)]₄ sheet (Fig. 2). The bent angle of the sulfur atom [C-S-C = 102.90 (10) °]. The Co-Co separation through a di-4-pyridyl sulfide ligand is 11.2646 (10) Å, and through the diagonal of the rhombus is 15.355 (2) Å. There are six intramolecular C—H \cdots N and C—H \cdots Cl hydrogen bonding contacts around the coordination sphere of the cobalt atom (Tab. 2). The packing of the layered structure is shown in Fig.3.

S2. Experimental

To a stirred solution of di-4-pyridyl sulfide (0.5 mmol) in ethanol-H₂O 20 ml (v/v, 1:1) was added solid CoCl₂(0.5 mmol). Then the obtained mixture was basified with NaOH (0.5 mol/l) to a pH of 6.0 and stirred at 343K for 4h, filtrated. One week later, red crystals appeared.

S3. Refinement

The H atoms were positioned geometrically and treated as riding, with C—H = 0.93 Å (CH) and $U_{iso}(H) = 1.2U_{eq}(C)$.

Figure 1

A view of the local coordination of the Co(II) cation in the title compound. Displacement ellipsoids are drawn at the 30% probability level. Symmetry codes: (A) $(-x, 1 - y, 1 - z)$; (B) $(-1 + x, 3/2 - y, -1/2 + z)$; (C) $(1 - x, -1/2 + y, 3/2 - z)$.
