## 4-(Dimethylamino)phenyl ethynyl telluride

Joan Farran, Angel Alvarez-Larena, Joan F. Piniella and Mario V. Capparelli*<br>Unitat de Cristal•lografia, Universitat Autònoma de Barcelona, 08193 Bellaterra, Spain<br>Correspondence e-mail: mariocapparelli@cantv.net

Received 25 February 2009; accepted 13 March 2009
Key indicators: single-crystal X-ray study; $T=294 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$; $R$ factor $=0.034 ; w R$ factor $=0.087$; data-to-parameter ratio $=21.8$.

The title compound, $\mathrm{C}_{10} \mathrm{H}_{11} \mathrm{NTe}$, is the first organyl ethynyl telluride, $R-\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}-\mathrm{H}$, to be structurally characterized. In the L-shaped molecule, the aryl moiety, viz. $\mathrm{Me}_{2} \mathrm{NC}_{6} \mathrm{H}_{4} \mathrm{Te}$, is almost perpendicular to the $\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}-\mathrm{H}$ fragment. The $\mathrm{Te}-\mathrm{Csp}^{2}$ bond $[2.115$ (3) $\AA$ ] is significantly longer than the $\mathrm{Te}-\mathrm{Csp}$ bond $[2.041$ (4) $\AA$ ]. The $\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}$ group is approximately linear $\left[\mathrm{Te}-\mathrm{C}-\mathrm{C}=178.5(4)^{\circ}\right.$ and $\mathrm{C} \equiv \mathrm{C}=$ 1.161 (5) $\AA$ ], while the coordination at the Te atom is angular $\left[\mathrm{C}-\mathrm{Te}-\mathrm{C}=95.92(14)^{\circ}\right]$. In the crystal structure, there are $\mathrm{Csp}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds which are perpendicular to the $\mathrm{CNMe}_{2}$ group; the N atom displays some degree of pyramidalization. Centrosymmetrically related pairs of molecules are linked by $\mathrm{Te} \cdots \pi$ (aryl) interactions, with $\mathrm{Te} \cdots C g=$ 3.683 (4) $\AA$ and $\mathrm{Csp}-\mathrm{Te} \cdots C g=159.1(2)^{\circ}(C g$ is the centroid of the benzene ring). These interactions lead to the formation of zigzag ribbons which run along $c$ and are approximately parallel to (110).

## 4-(Dimethylamino)phenyl ethynyl telluride

Joan Farran, Angel Alvarez-Larena, Joan F. Piniella and Mario V. Capparelli

## S1. Comment

Although organotellurium compounds have attracted considerable interest as reagents and intermediates in organic synthesis (Petragnani, 1994), only a limited number of compounds with mono- and ditelluroethyne cores, $\mathrm{R}-\mathrm{Te}-\mathrm{C} \equiv \mathrm{CH}$ and $\mathrm{R}-\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}-\mathrm{Te}-R^{\prime}$, have been reported, in spite of the potential reactivity of the acetylene unit towards addition reactions. We recently reported the syntheses and crystal structures of several symmetrical ( $R=R^{\prime}$ ) bis(aryltelluro) ethynes, $\mathrm{Ar}-\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}-\mathrm{Te}-\mathrm{Ar}$ (Farran et al., 2002). On the other hand, only five $\mathrm{R}-\mathrm{Te}-\mathrm{C} \equiv \mathrm{CH}$ derivatives have been prepared so far, with $R=\mathrm{Me}, \mathrm{Et},{ }^{\mathrm{i}} \mathrm{Pr}$, $\mathrm{n}-\mathrm{Bu}$ and Ph (Kauffmann \& Ahlers, 1983; Dabdoub et al., 1998; Potapov \& Trofimov, 2005; Yoshimatsu, 2005), and none has been structurally characterized (in addition, molecular orbital calculations for $R=\mathrm{HC} \equiv \mathrm{C}$ were carried out by Murai et al., 1994). Here we describe the crystal structure of the title compound ( $R=p-\mathrm{Me}_{2} \mathrm{NC}_{6} \mathrm{H}_{4}$ ), the first of an organyl ethynyl telluride to be reported.
The structure analysis showed that the crystal contains discrete $L$-shaped molecules of the title compound (Figure 1), in which the aryl moiety, $\mathrm{Me}_{2} \mathrm{NC}_{6} \mathrm{H}_{4} \mathrm{Te}$, is almost perpendicular to the $\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}-\mathrm{H}$ fragment ( $c f . \mathrm{C}-\mathrm{Te}-\mathrm{C}$ angle, Table 1), but bent $c a 13^{\circ}$ towards the $\mathrm{C} 12-\mathrm{C} 13$ side of the ring ( $c f . \mathrm{C}-\mathrm{Te}-\mathrm{C}-\mathrm{C}$ angles, Table 1 ), probably to optimize the $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{N}$ interaction (see below).
As expected, the $\mathrm{Te}-\mathrm{C}\left(s p^{2}\right)$ bond is significantly longer than the $\mathrm{Te}-\mathrm{C}(s p)$ one. The $\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}$ moiety is approximately linear, while the coordination at the Te atom is angular, as predicted by the valence-shell electron-pair repulsion (VSEPR) model for an $\mathrm{AX}_{2} \mathrm{E}_{2}$ molecule (Gillespie \& Hargittai, 1991). The values of these geometric parameters (Table 1) are similar to the ranges observed in several bis(arytelluro)ethynes, $\mathrm{Ar}-\mathrm{Te}-\mathrm{C} \equiv \mathrm{C}-\mathrm{Te}-\mathrm{Ar}$ (Farran et al., 2002), viz. $\mathrm{Te}-\mathrm{C}\left(s p^{2}\right), 2.103$ (5)-2.142 (6) $\AA$; $\mathrm{Te}-\mathrm{C}(s p), 2.021$ (6)-2.058 (6) $\AA$; $\mathrm{C} \equiv \mathrm{C}, 1.166$ (12)-1.203 (11) $\AA$ and $\mathrm{C}-\mathrm{Te}-\mathrm{C}$, 94.2 (3)-97.2 (2) ${ }^{\circ}$, which are substantially smaller than the tetrahedral value $\left(109.5^{\circ}\right)$ due to the repulsion of the lone pairs of electrons on the bonded ones.

In the crystal structure the molecules are linked by $\mathrm{C}(s p)-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds (Table 2 ) which are perpendicular to the $\mathrm{CNMe}_{2}$ group. The N atom displays some degree of pyramidalization: it is 0.123 (5) $\AA$ out of the plane of the three C atoms, towards the H atom. There are also $\mathrm{Te} \cdots \pi(\operatorname{aryl})$ interactions, similar to those described by Zukerman-Schpector \& Haiduc (2001) or Schulz Lang et al. (2006) for Te(IV) compounds, in which centrosymmetrically related pairs of molecules are at $\mathrm{Te} \cdots C g 3.683$ (4) $\AA$ and $\mathrm{C}(s p) — \mathrm{Te} \cdots C g 159.1(2)^{\circ}(C g=$ centroid of the phenyl ring at $1-x,-y, 1-z)$. These interactions lead to the formation of zigzag ribbons, made of pairs of chains, which run along c and are approximately parallel to (110) (Figure 2).

## S2. Experimental

Ethynyl magnesium bromide, $\mathrm{HC} \equiv \mathrm{CMgBr}$, was prepared according to published procedures (Brandsma, 1988). The corresponding diaryl ditelluride, $\left(\mathrm{Me}_{2} \mathrm{NC}_{6} \mathrm{H}_{4} \mathrm{Te}\right)_{2}$, was synthesized as reported elsewhere (Petragnani et al., 1975). A dark solution of the diaryl ditelluride ( $2.0 \mathrm{mmol}, 0.94 \mathrm{~g}$ ) in 40 ml of THF was treated dropwise with bromine ( $2.0 \mathrm{mmol}, 0.32$
$\mathrm{g}, 0.10 \mathrm{ml}$ ) in 10 ml of benzene, at $0^{\circ} \mathrm{C}$, in $\mathrm{N}_{2}$ atmosphere, while efficient cooling was applied. The Grignard reagent was then added dropwise. Gradual disappearance of the dark color of the solution was observed until it finally became almost colorless when about $10 \%$ excess of the reagent was added. After stirring for 30 min at room temperature, the solution was diluted with 50 ml of low boiling point petroleum ether, treated with aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and washed with brine. The organic layer was dried over magnesium sulfate and the solvents were evaporated. The residue was purified by flash chromatography (silica gel/hexane). Yield $51 \%$. Crystals suitable for X-ray analysis were obtained by slow evaporation of a chloroform solution. The specimen used for data collection was air-protected with a thin coat of Loctite epoxy adhesive.

## S3. Refinement

Hydrogen atoms were placed in calculated positions using a riding atom model with fixed $\mathrm{C}-\mathrm{H}$ distances $[0.93 \AA$ for $\mathrm{C}(s p)$ and $\mathrm{C}\left(s p^{2}\right), 0.96 \AA$ for $\left.\mathrm{C}\left(s p^{3}\right)\right]$ and $U_{\text {iso }}=\mathrm{p} U_{\mathrm{eq}}($ parent atom $)\left[\mathrm{p}=1.2\right.$ for $\mathrm{C}(s p)$ and $\mathrm{C}\left(s p^{2}\right), 1.5$ for $\left.\mathrm{C}\left(s p^{3}\right)\right]$.

Figure 1
Molecular structure of the title compound showing the atomic numbering. Displacement ellipsoids are drawn at 50\% probability level.

Figure 2
View of the zigzag ribbon generated by the hydrogen bonds and the $\mathrm{Te} \cdots \pi($ aryl) interactions (shown as dashed lines).

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
