## 3-Methyl-2-propionamidobutanoic acid

Bohari M. Yamin and Eliyanti A. Othman*

School of Chemical Sciences and Food Technology, Universiti Kebangsaan Malaysia, UKM 43500 Bangi Selangor, Malaysia
Correspondence e-mail: eliyanti84@yahoo.com

Received 21 January 2009; accepted 26 February 2009
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.059 ; w R$ factor $=0.167$; data-to-parameter ratio $=16.1$.

The reaction of propionyl isothiocyanate with valine was found to give the title compound, $\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{NO}_{3}$, instead of the expected thiourea product. The whole molecule is non-planar and the carbonyl group is cis to the methylbutanoic acid group across the $\mathrm{C}-\mathrm{N}$ bond. Intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds build up a two-dimensional network developing parallel to (100).

## 3-Methyl-2-propionamidobutanoic acid

## Bohari M. Yamin and Eliyanti A. Othman

## S1. Comment

The carbonoyl isothiocyanate is a well known intermediate for the synthesis of carbonoylthiourea deriatives. However, some carbonoyl isothiocyanates such as propionyl isothiocyanate was reactive enough to give $N$-propionylthiourea (Yamin \& Othman, 2008) after sitrring for about 1 h . In the present study, the reaction of propionyl isothiocyanate with valine did not give the expected thiourea derivative but instead the 3-methyl-2-propionamidobutanoic acid (I), thus indicating a nucleophilic substitution of the isothiocyanato group by the amino group of the amino acid.
The molecule adopts cis configuration with respect to the position of the 3-methylbutanoic acid group relative to the carbonyl O 3 atom across the $\mathrm{C} 3-\mathrm{N} 1$ bond. The bond lengths and angles are within normal ranges (Allen et al., 1987). The acetamide $[\mathrm{O} 3 / \mathrm{N} 1 / \mathrm{C} 2 / \mathrm{C} 3 / \mathrm{C} 4(\mathrm{~A})]$ and acetate $[\mathrm{O} 1 / \mathrm{O} 2 / \mathrm{C} 4 / \mathrm{C} 8(\mathrm{~B})]$ fragments are essentially planar with maximum deviation of 0.011 (2) $\AA$ for atom N1. The compound has a stereogenic center at C4 but the space group is centrosymmetric so the molecule exists as a racemate $(R / S)$.
$\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ intermolecular hydrogen bonds build up a two dimensional network with a corrugated iron shape developping parallel to the $\left(\begin{array}{ll}1 & 0\end{array}\right)$ plane.

## S2. Experimental

A solution of propionylisothiocyanate $(1.15 \mathrm{~g}, 0.01 \mathrm{~mol})$ in 30 ml acetone was added into a flask containing 30 ml acetone solution of valine $(1.17 \mathrm{~g}, 0.01 \mathrm{~mol})$. The mixture was refluxed for 5 h . The solution was filtered and left to evaporate at room temperature. The colourless solid were obtained after one day of evaporation(yield $85 \%$, m.p 475.1476.3 K)

## S3. Refinement

H atoms attached to carbon atoms were positioned geometrically and treated as riding on their parent atoms with $\mathrm{C}-\mathrm{H}=$ $0.96-0.98 \AA$ and $U_{\text {iso }}(\mathrm{H})=x U_{\mathrm{eq}}(\mathrm{C})$ where $x=1.5$ for $\mathrm{CH}_{3}$ group and 1.2 for $\mathrm{CH}_{2}$ and CH groups. The hydrogen atoms attached to nitrogen and oxygen atoms were located from Fourier difference map and refined isotropically,

## Figure 1

The nolecular structure of (I) with the atom-labeling scheme. Ellipsoids are drawn at the $30 \%$ probability level. H atoms are represented as small spheres of arbitrary radii. The enantiomer represented has S configuration.

## Figure 2

Partial packing view of I showing the H bonds network. Hydrogen bonds are shown as dashed lines. [Symmetry codes:

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
