Received 9 March 2009; accepted 11 March 2009

Key indicators: single-crystal X-ray study; $T=153 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$; $R$ factor $=0.066 ; w R$ factor $=0.192$; data-to-parameter ratio $=13.3$.

In the title molecule, $\mathrm{C}_{5} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{~S}$, the thiazine ring shows a conformation close to a half-boat. The Cremer \& Pople puckering parameters of the thiazine ring are $q 2=$ 0.4645 (2) $\AA, \theta=132.4$ (3) and $\varphi=285.52$ (2) ${ }^{\circ}$. The packing is stabilized by intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ interactions.

## Yu-wen Peng and Lin-hai Wu

## S1. Comment

The frequent occurence of pesticide residues accidents and the introduction of Green Trade Barriers to protect human health threaten export and national agriculture market and highlights the importance of food safely. Therefore, the development of pesticides with new chemical structures and high insecticidal activities with low residues is highly desirable. Consequently, spurred by the need for new pesticidal agents and the fact that many new effective pesticides possess heterocyclic rings in their structure, such as the thiazine ring (Soloway et al., 1978; Tomizawa et al., 1995), over the last few years, we have synthesized some novel thiazine derivatives. Here, we report the crystal structure of ( $Z$ )-( $1,3-$ thiazinan-2-ylideneamino)formonitrile.
In (Z)-(1,3-thiazinan-2-ylideneamino)formonitrile (Fig. 1), all bond lengths are normal (Allen et al., 1987) and in a good agreement with those reported previously (Kálmán, et al., 1977). It is known that the imino tautomers can exist as two geometrical isomers, syn $(Z)$ and anti (E), but in this crystal, only $Z$ isomers have been observed. The thiazine ring shows a conformation near to half boat with the C 2 atom deviating 0.618 (2) $\AA$ above the plane formed by $\mathrm{S} 1, \mathrm{C} 1, \mathrm{~N} 1, \mathrm{C} 3$ and C 4 [maximum least squares plane deviation for S 10.053 (3) $\AA$ ]. This geometry is proved by the puckering parameters q2 $=0.4645(2) \AA, \theta=132.4(3)^{\circ}$ and $\varphi=285.52(2)^{\circ}($ Cremer $\&$ Pople, 1975). There are some weak $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{S}$ intermolecular interactions (see Table 1) which stabilize the title structure.

## S2. Experimental

A mixture of dimethyl cyanocarbonimidodithioate $10 \mathrm{mmol}(1.46 \mathrm{~g})$ and 3-aminopropane-1-thiol ( $1.00 \mathrm{~g}, 11 \mathrm{mmol}$ ) was refluxed in absolute EtOH ( 20 ml ) for 3 h . On cooling, the product crystallizes and was filtered and then recrystallized from absolute ethanol. Yield $1.20 \mathrm{~g}(85 \%)$. Single crystals suitable for X-ray measurements were obtained by recrystallization from ethanol at room temperature.

## S3. Refinement

H atoms were positioned geometrically and refined using a riding model, with $\mathrm{C}-\mathrm{H}=0.99 \AA, \mathrm{~N}-\mathrm{H}=0.86 \AA$ with $U_{\text {iso }}(\mathrm{H})=1.2$ times $U_{\text {eq }}(\mathrm{C}, \mathrm{N})$.

Figure 1
The molecular structure of (I), with atom labels and $40 \%$ probability displacement ellipsoids for non-H atoms.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.066$
$w R\left(F^{2}\right)=0.192$
$S=1.09$
1101 reflections
83 parameters
0 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map

> 4731 measured reflections
> 1101 independent reflections
> 970 reflections with $I>2 \sigma(I)$
> $R_{\text {int }}=0.032$
> $\theta_{\max }=25.0^{\circ}, \theta_{\min }=3.2^{\circ}$
> $h=-8 \rightarrow 8$
> $k=-14 \rightarrow 15$
> $l=-10 \rightarrow 10$

Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{0}{ }^{2}\right)+(0.1515 P)^{2}+0.068 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=1.14 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.32$ e $\AA^{-3}$
Extinction correction: SHELXTL (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$

Extinction coefficient: 0.040 (14)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
