W. Goethe-Universität Frankfurt, Max-von-Laue-Strasse 7, 60438 Frankfurt/Main, Germany
Correspondence e-mail: bolte@chemie.uni-frankfurt.de
Received 5 March 2009; accepted 5 March 2009
Key indicators: single-crystal X-ray study; $T=173 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.001 \AA$; $R$ factor $=0.043 ; w R$ factor $=0.120$; data-to-parameter ratio $=20.7$.

In the title compound, $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{4}$, an intermediate for the synthesis of a new kind of estrogen receptor modulator, all non-H atoms lie on a common plane (r.m.s. deviation $=$ $0.0472 \AA$ ). All $\mathrm{C}-\mathrm{C}$ bonds in the side chain are in a trans conformation, and the hydroxyl group is also trans to the methylene chain. In the crystal structure, molecules form centrosymmetric dimers showing a head-to-head arrangement which is stabilized by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds. A weak $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ contact is also present.

## 4-(3-Methoxyphenoxy)butyric acid

## Julia Heilmann-Brohl, Gérard Jaouen and Michael Bolte

## S1. Comment

4-(3-Methoxyphenoxy)butyric acid is an intermediate for the synthesis of a new kind of estrogen receptor modulators (Lloyd et al., 2004). All non-H atoms of the title compound (Fig. 1) lie in a common plane (r.m.s. deviation $0.0472 \AA$ ). All C-C bonds in the side chain are in a trans conformation, and the hydroxyl group is also trans to the methylene chain. In the crystal, the molecules form centrosymmetric dimers showing a head-to-head arrangement which is stabilized by $\mathrm{O}-\mathrm{H}^{\cdots} \mathrm{O}$ hydrogen bonds (Fig. 2). In addition to this classical hydrogen bond, there is weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contact (Table 1).

Two comparable structures, 4-(4-chlorophenoxy)butanoic acid and 4-(2,4-dichlorophenoxy)butanoic acid, (Smith et al., 1989) adopt a very similar conformation as the title compound. However, the carboxyl group in these structures is slightly twisted out of the molecular plane. The $\mathrm{HO}-\mathrm{C}(\mathrm{O})-\mathrm{CH}_{2}-\mathrm{CH}_{2}$ torsion angle is $161.6^{\circ}$ and $170.1^{\circ}$ in 4-(4chlorophenoxy)butanoic acid and 4-(2,4-dichlorophenoxy)butanoic acid, respectively, whereas this torsion angle amounts to 174.73 (9) ${ }^{\circ}$ in the title compound.

## S2. Experimental

Synthesis of 4-(3-methoxy-phenoxy)-butyric acid ethyl ester (scheme 2):
$\mathrm{Cs}_{3} \mathrm{CO}_{3}(9.666 \mathrm{mmol}, 3.149 \mathrm{~g})$ was added to a solution of 3-methoxyphenol $(8.055 \mathrm{mmol}, 1.000 \mathrm{~g})$ in acetone $(20 \mathrm{ml})$ and the mixture was stirred for 5 min at r.t.. Ethyl-4-bromobutyrate $(8.055 \mathrm{mmol}, 1.571 \mathrm{~g})$ was added and the reaction mixture was heated under reflux for 28 h . After cooling to r.t. the slurry was poured onto $\mathrm{H}_{2} \mathrm{O} / \mathrm{ice} / \mathrm{HCl}$ and the aqeous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 25 \mathrm{ml})$. The combined organic layers were washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 25 \mathrm{ml})$, dried over $\mathrm{MgSO}_{4}$ and the solvent was removed under reduced pressure to yield the crude product as a slightly yellow oil. The crude product was subjected to a column chromatography (eluent $100 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ), to obtain the pure product as a slightly yellow oil ( $1.486 \mathrm{~g}, 77 \%$ ). ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, \mathbf{3 0 0} \mathbf{~ M H z}\right): \delta=7.165\left(\operatorname{tr}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}_{6} H_{4}\right), 6.519-6.447\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{C}_{6} H_{4}\right), 4.146$ (q, $J=7.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H} 12), 3.987\left(\operatorname{tr}, J=6.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}^{8}\right), 3.780\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{3}\right), 2.509\left(\operatorname{tr}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H} \mathrm{H}^{10}\right), 2.145-$ $2.055\left(\mathrm{~m}, 2 \mathrm{H} \mathrm{H}^{9}\right), 1.259\left(\operatorname{tr}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{H}^{13}\right)$.
Synthesis of 4-(3-methoxy-phenoxy)-butyric acid (scheme 3):
4-(3-methoxy-phenoxy)-butyric acid ethyl ester ( $2.938 \mathrm{mmol}, 0.700 \mathrm{~g}$ ) is dissolved in acetone ( 10 ml ) and $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{ml})$ and $1 M \mathrm{NaOH}(20 \mathrm{ml})$ is added. The reaction mixture is stirred at r.t. for 1 h and is then poured into $\mathrm{H}_{2} \mathrm{O} / \mathrm{HCl}(50 \mathrm{ml})$. The aqeous phase is extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 x 25 \mathrm{ml})$, and the combined organic layers are washed with $\mathrm{H}_{2} \mathrm{O}(2 x 30$ ml ), dried over $\mathrm{MgSO}_{4}$ and the solvent is evaporated. The crude product is obtained as light yellow oil from which colourless crystals - suitable for X-Ray analysis - start to grow within 30 min . Purification of the crude product is conducted by column chromatography. The by-products are removed by elution with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The desired product is then eluted with MeOH . After evaporation of MeOH , the pure product is obtained as an off-white crystalline solid ( 0.352 g , $58 \%) .{ }^{1} \mathbf{H}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, \mathbf{3 0 0} \mathbf{~ M H z}\right): \delta=7.171\left(\operatorname{tr}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}_{6} H_{4}\right), 6.526-6.447\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{C}_{6} H_{4}\right), 4.010(\operatorname{tr}, J=6.0$
$\left.\mathrm{Hz}, 2 \mathrm{H}, \mathrm{H}^{8}\right), 3.787\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{3}\right), 2.592\left(\mathrm{tr}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}^{10}\right), 2.174-2.073\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}^{9}\right)$, n.o. $(\mathrm{COOH})$.

## S3. Refinement

H atoms bonded to C were refined with fixed individual displacement parameters $\left[\mathrm{U}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})\right.$ or $\mathrm{U}(\mathrm{H})=1.5$ $\left.U_{\text {eq }}\left(\mathrm{C}_{\text {methyl }}\right)\right]$ using a riding model with $\mathrm{C}_{\text {aromatic }}-\mathrm{H}=0.95 \AA, \mathrm{C}_{\text {methyl }}-\mathrm{H}=0.98 \AA$, and $\mathrm{C}_{\text {methylene }}-\mathrm{H}=0.99 \AA$. The methyl group was allowed to rotate but not to tip. the hydroxy H atom was freely refined.

## Figure 1

Extinction correction: SHELXL97 (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$

Extinction coefficient: 0.048 (5)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
