Received 25 February 2009; accepted 8 March 2009

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.006$  Å;  $R$  factor = 0.034;  $wR$  factor = 0.060; data-to-parameter ratio = 15.5.

In the title compound,  $[\text{PdCl}_2(\text{C}_7\text{H}_9\text{N})_2]$ , the Pd atom is situated on an inversion centre and displays a distorted square-planar coordination environment. The crystal structure displays weak intermolecular  $\text{N}-\text{H}\cdots\text{Cl}$  hydrogen bonding.

**S1. Comment**

Palladium complex compounds with *N*-containing organic ligands attract constant scientific interest due to its cytostatic and antitumoral activity (Curic *et al.*, 1996; Casas *et al.*, 2008). Asymmetric unit of title compound contains half of a molecule, other one generates by the symmetry operator of inversion centre (Fig. 1). Pd atom shows a square-planar geometry of coordination environment, which contain two chlorine atoms in *trans*-position and a two amino groups of *o*-toluidine. Bond lengths and angles have normal values (Allen *et al.*, 1987). The crystal structure displays weak intermolecular N—H $\cdots$ Cl hydrogen bonding (Table 1) creating the layered structure (Fig. 2).

**S2. Experimental**

The 5 ml of 0.02 *M* chloroform *o*-toluidine solution was poured into the test-tube. The other reactant, 5 ml 0.01 *M* water solution of K<sub>2</sub>PdCl<sub>4</sub> was carefully added on the top of the organic part. The sealed test-tube with double-layer mixture was put in a dark place. Two weeks later, the yellow plate shape crystals were grown in the chloroform part of the solution.

**S3. Refinement**

H atoms bonded to N atoms were located in a difference map. Other H atoms which bonded to C were positioned geometrically and refined using a riding model with C—H = 0.98 Å for CH<sub>3</sub> with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  and C—H = 0.95 Å for CH with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

**Figure 1**

Molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at 50% probability level. H atoms are presented as a small spheres of arbitrary radius. Symmetry code: (i)  $-x, 1-y, -z$ .

**Figure 2**

Crystal packing of title compound, projection along  $b$  axis. Dashed lines indicate hydrogen bonds [Symmetry code: (i)  $-x, y-1/2, 1/2-z$ ; (ii)  $x, 3/2-y, 1/2+z$ ].

 $\Delta\rho_{\max} = 0.48 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.66 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
