Received 11 May 2009; accepted 12 May 2009

Key indicators: single-crystal X-ray study;  $T = 295$  K; mean  $\sigma(C-C) = 0.007$  Å;  
 $R$  factor = 0.051;  $wR$  factor = 0.138; data-to-parameter ratio = 12.8.

The asymmetric unit of the title compound,  $[Co(C_{12}H_6N_2O_2)(H_2O)_4](NO_3)_2$ , consists of a Co<sup>II</sup> complex cation with twofold rotational symmetry and two nitrate anions. The Co<sup>II</sup> atom has a distorted octahedral geometry with the basal plane occupied by two 1,10-phenanthroline-5,6-dione N atoms and two aqua O atoms, with the other two aqua ligands in axial positions. The aqua ligands are involved in extensive hydrogen bonding to nitrate and 1,10-phenanthroline-5,6-dione O atoms.

## Tetraaqua(1,10-phenanthroline-5,6-dione- $\kappa^2N,N'$ )cobalt(II) dinitrate

Wen-Juan Shi

### S1. Comment

Phendione (1,10-phenanthroline-5,6-dione) is an excellent ligand that incorporates two functional groups with different coordination properties. Though phendione usually binds to metals through the imine N atoms (Onuegbu *et al.*, 2007), in some cases both the N and O donors are used simultaneously (Calderazzo *et al.*, 1999; Fox *et al.*, 1991; Paw & Eisenberg, 1997; Ruiz *et al.*, 1999; Shavaleev *et al.*, 2003). In this paper we report the synthesis and characterization of the title compound,  $[CoL(H_2O)_4] \cdot (NO_3)_2$  ( $L = 1,10\text{-phenanthroline-5,6-dione}$ ).

The molecular structure of the title compound, shown in Fig. 1, is made up of a  $[CoL(H_2O)_4]^{2+}$  cation and two nitrate anions, which the cations have twofold rotational symmetry. The cobalt atom is coordinated to the two N atoms of a phendione ligand and four aqua ligands to form distorted octahedral geometry. The C=O bond length in the phendione ligand [1.208 (6) Å] is comparable to those observed in other complexes of phendione (Allen *et al.*, 1987). The Co—N bond lengths [2.121 (3) Å] are similar to those values in related phenanthroline and phendione derivatives of cobalt(II) (Liu *et al.*, 2008; Rubin-Preminger *et al.*, 2008).

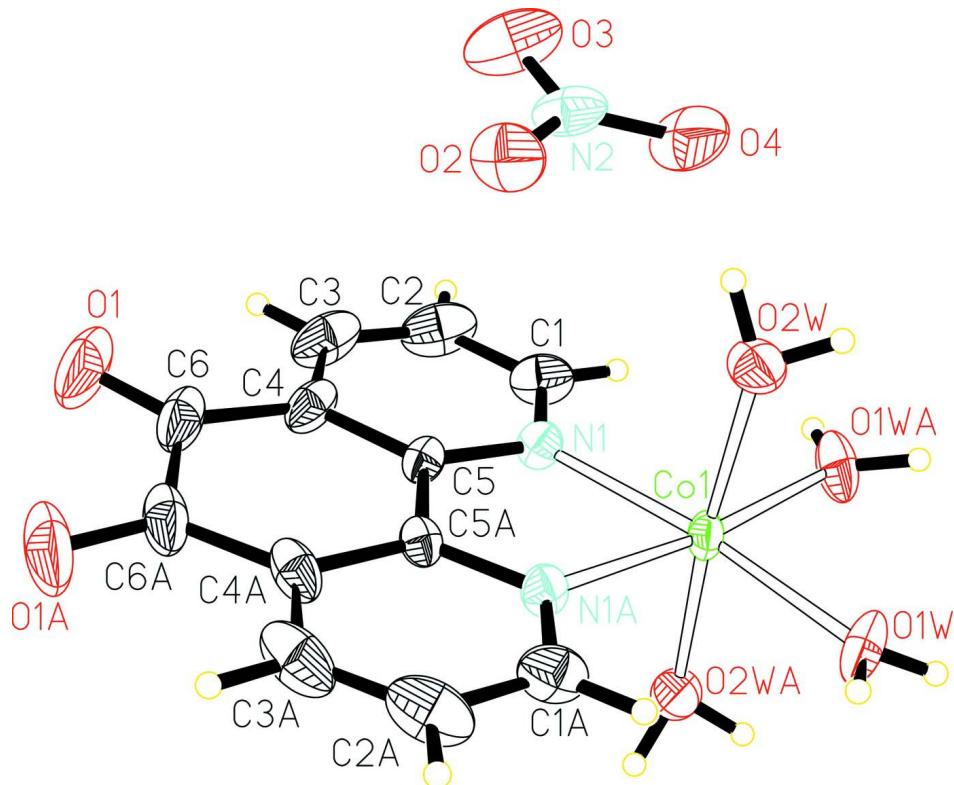

In addition to the strong O—H···O hydrogen bonds formed by the water ligands to both the nitrate and phendione O atoms, there are  $\pi$ – $\pi$  stacking interactions between adjacent phendione ligands [perpendicular interplanar distance 3.582 (1) Å and centroid-to-centroid distance 3.823 (1) Å] (Fig. 2).

### S2. Experimental

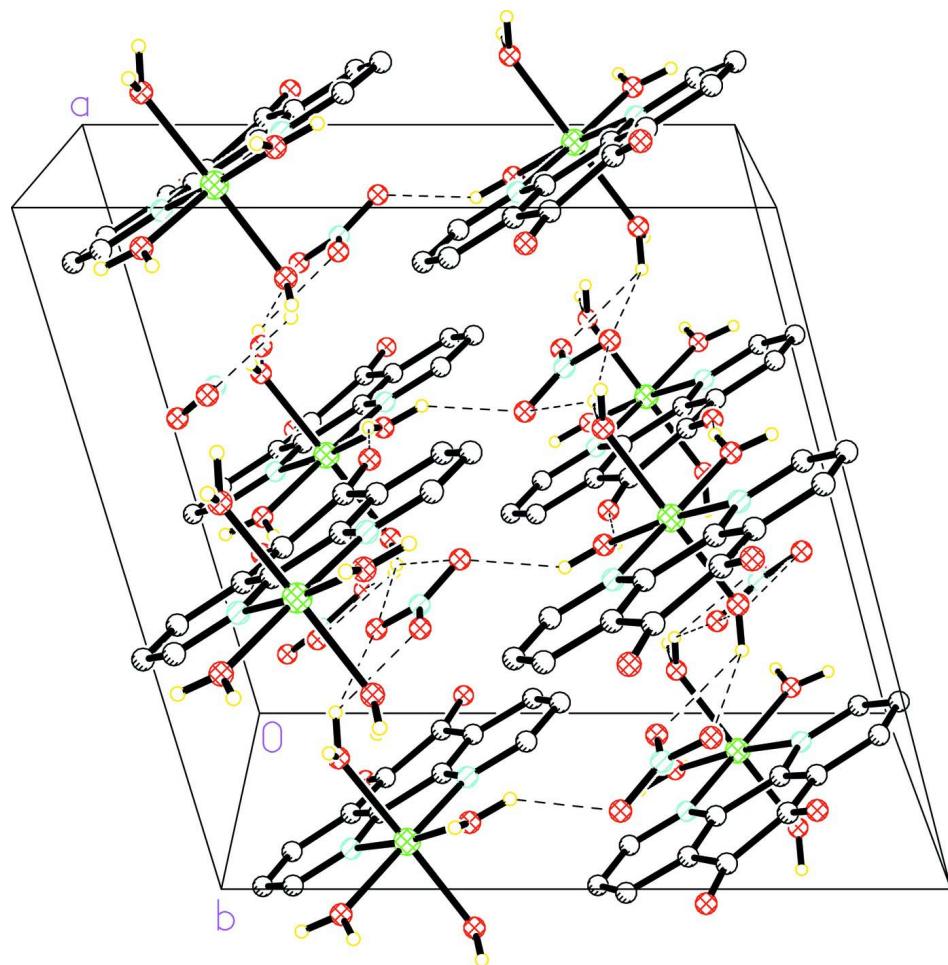

A solution of cobalt(II) nitrate hexahydrate (29.1 mg, 0.10 mmol) and phendione (21.0 mg, 0.10 mmol) in methanol (8 ml) was stirred for 2 h. After filtering, the filtrate was left at room temperature for about one week and purple, block-like crystals of the title compound appeared [yield: 18 mg (39%)].

### S3. Refinement

The water H atoms were located in a difference Fourier map and refined with  $U_{iso}(H) = 1.5U_{eq}(O)$ . The O—H distances of water were refined with idealized values of 0.85 Å. The aromatic H-atoms were positioned geometrically and refined using a riding model with  $d(C-H) = 0.93$  Å,  $U_{iso}=1.2U_{eq}$  (C).

**Figure 1**

The molecular structure of the title compound, with displacement ellipsoids drawn at the 30% probability level. Hand H atoms are drawn as spheres of arbitrary radius. [Symmetry code, A: 1-x, y, 1/2-z].

**Figure 2**

Packing diagram of the title structure, showing the intermolecular O—H···O hydrogen bonds as dashed lines.

$0.18 \times 0.14 \times 0.13$  mm

#### Data collection

Bruker SMART APEX area-detector  
diffractometer

Radiation source: fine-focus sealed tube

Graphite monochromator

$\phi$  and  $\omega$  scans

Absorption correction: multi-scan  
(SADABS; Sheldrick, 1996)

$T_{\min} = 0.830$ ,  $T_{\max} = 0.873$

4509 measured reflections

1695 independent reflections

1549 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.020$   
 $\theta_{\text{max}} = 26.0^\circ, \theta_{\text{min}} = 2.5^\circ$

$h = -15 \rightarrow 15$   
 $k = -5 \rightarrow 13$   
 $l = -16 \rightarrow 15$

#### Refinement

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.051$   
 $wR(F^2) = 0.138$   
 $S = 1.04$   
1695 reflections  
132 parameters  
12 restraints  
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map  
Hydrogen site location: inferred from neighbouring sites  
H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.071P)^2 + 5.1444P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\text{max}} < 0.001$   
 $\Delta\rho_{\text{max}} = 0.68 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.61 \text{ e } \text{\AA}^{-3}$

#### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
