## 3-Ammonio-4-hydroxybenzoate monohydrate

Sami Ullah, ${ }^{\text {a }}$ M. Nawaz Tahir, ${ }^{\text {b }}$ * Durre Shahwar, ${ }^{\text {a }}$ Zaheer-ud-Din Khan ${ }^{\text {c }}$ and Muhammad Akmal Khan ${ }^{\text {a }}$<br>${ }^{\text {a }}$ Department of Chemistry, Government College University, Lahore, Pakistan, ${ }^{\text {b }}$ Department of Physics, University of Sargodha, Sargodha, Pakistan, and ${ }^{\text {c }}$ Department of Botany, Government College University, Lahore, Pakistan Correspondence e-mail: dmntahir_uos@yahoo.com

Received 7 May 2009; accepted 9 May 2009
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.042 ; w R$ factor $=0.118$; data-to-parameter ratio $=13.6$.

The title compound, $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{NO}_{3} \cdot \mathrm{H}_{2} \mathrm{O}$, which crystallized as a hydrate, was obtained from an extraction of the plant species Saussurea atkinsonii of the asteraceae family collected from the hilly area (Ayubia) of Pakistan during the flowering season. The dihedral angle between the benzene ring and the carboxylate group is $25.64(5)^{\circ}$. In the crystal, the packing is consolidated by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, as well as weak aromatic $\pi-\pi$ stacking [centroid-centroid separation $=3.9365$ (9) $\AA$ ] and $\mathrm{C}=\mathrm{O} \cdots \pi$ interactions.

## 3-Ammonio-4-hydroxybenzoate monohydrate

Sami Ullah, M. Nawaz Tahir, Durre Shahwar, Zaheer-ud-Din Khan and Muhammad Akmal Khan

## S1. Comment

The medicinal plants are available all over the world. Locally available plant specie Saussurea atkinsonii of asteraceae family was collected from hilly area (Ayubia) of Pakistan during the flowering season. The plant was dried inside room for 20-25 days. The title compound (I), (Fig. 1), is an extract of it in chloroform and methanol. The study of its bioactivity is in progress.
The crystal structure of (II) (4-vinylphenyl 3-amino-4-hydroxybenzoate or bagremycin A (Bertasso et al., 2001), has been reported which contains the aromatic ring along with heavy atoms of the substituants of (I). In the title compound, the bond distances and bond angles are within normal ranges (Allen et al., 1987). The benzene ring A (C1-C6) is planar and is oriented at a dihedral angle of $25.64(5)^{\circ}$ with the $\mathrm{CO}_{2}$ group. The N -atom of ammonium is in plane of the ring A , whereas the O-atom of hydroxy group is at a distance of -0.0580 (21) $\AA$ from the same.
There exist intensive intermolecular H-bonding (Table 1), resulting in three-dimensional polymeric network. There also exist $\mathrm{CgA} \cdots \mathrm{CgA}^{\mathrm{i}}$ [symmetry code $\left.\mathrm{i}=1-x, 1-y,-z\right]$ interaction at a distance of $3.9365(9) \AA$, where CgA is the centroid of aromatic ring. The molecules may also be stabilized due to $\mathrm{C}==\mathrm{O} \cdots \pi$ interaction (Table 1).

## S2. Experimental

The Specie Saussurea atkinsonii of asteraceae family was dried inside room for 20-25 days as a whole and grinded. The extract was obtained using soxhlet apparatus in $50 \%$ chloroform and $50 \%$ methanol and it was subjected to isolation by performing column chromatography and thin layer chromatography. The extract obtained was recrystallized from methanol and light brown rods of (I) were obtained. The water found in the structure was presumably incorporated from the atomsphere.

## S3. Refinement

The coordinates of H -atoms of hydroxy, ammonium moiety and water molecule were refined. The other H -atoms were positioned geometrically, with $\mathrm{C}-\mathrm{H}=0.93 \AA$ for aromatic type and constrained to ride on their parent atoms, with $\mathrm{U}_{\mathrm{iso}}(\mathrm{H})$ $=1.2 \mathrm{U}_{\mathrm{eq}}(\mathrm{C}, \mathrm{N}, \mathrm{O})$.

Figure 1
View of (I) with displacement ellipsoids drawn at the $50 \%$ probability level. H-atoms are shown by small circles of arbitrary radius.

## Figure 2

The partial packing of (I), showing that molecules form three-dimensional polymeric network.

$\Delta \rho_{\text {min }}=-0.24 \mathrm{e} \AA^{-3}$

## Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
