## (2S)-Methyl 2-(p-toluenesulfonamido)propanoate

Tayyaba Syed, ${ }^{\text {a }}$ Shahid Hameed, ${ }^{\text {a* }}$ Peter G. Jones ${ }^{\text {b }}$ and Andrea Schmidt-Meier ${ }^{\text {b }}$<br>${ }^{\text {a }}$ Department of Chemistry, Quaid-i-Azam University, Islamabad-45320, Pakistan, and ${ }^{\mathbf{b}}$ Institut for Anorganische und Analytische Chemie, Technische Universität Braunschweig, Hagenring 30, 38106 Braunschweig, Germany<br>Correspondence e-mail: shameed@qau.edu.pk

Received 29 April 2009; accepted 8 May 2009
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.001 \AA$; $R$ factor $=0.022 ; w R$ factor $=0.063$; data-to-parameter ratio $=26.6$.

The enantiomerically pure title compound, $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{NO}_{4} \mathrm{~S}$, contains a pyramidal N atom with an $\mathrm{S}-\mathrm{N}$ bond length of 1.6262 (8) A. In the crystal, molecules are linked to form chains parallel to the a axis by the hydrogen bond from NH to the carbonyl oxygen. $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions are also present.

## S1. Comment

Because of their versatility and harmlessness, esters have found many applications in the food and cosmetics industries (Soni et al., 2002). They have been reported as emulsifiers, dispersants, or thickeners. In addition to their use as intermediates in the synthesis of a large number of heterocyclic compounds (Chen et al., 2007; Kucukguzel et al., 2007; Akhtar et al., 2007), esters have also been used in the pharmaceutical industry as nervous system depressants, intestinal antiseptics and antibacterials (Iqbal et al., 2008). Sulfonamides, on the other hand, constitute an important class of drugs with several types of pharmacological activities (Akhtar et al., 2008; Zareef et al., 2007). The title compound (I) was synthesized in our laboratory as an intermediate for onward conversion to 1,3,4-oxadiazole derivatives, with a view to explore their anti-HIV and anti-HCV activities.
The molecule of (I) is shown in Fig. 1. Bond lengths and angles may be regarded as normal. In particular, the $\mathrm{N}-\mathrm{S}$ bond length is 1.6262 (8) $\AA \AA$; a search of the Cambridge Database (Allen, 2002; Version 1.11) revealed 817 examples of the fragment $\mathrm{Ph}-\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}\left(s p^{3}\right)$ (including substituted Ph rings) with a mean bond length of $1.614 \AA$. The nitrogen atom displays a pyramidal geometry, with N lying 0.293 (7) $\AA$ out of the plane of S, C2 and H01. The database hits showed a highly skewed distribution for this displacement, with many values of exactly zero; this is presumably attributable to fixing the hydrogen assuming planar geometry (AFIX 43 in the SHELX system), whereby the assumption of planarity is clearly not justified. Neglecting the zero values, the average deviation for 462 values is $0.24 \AA$. The sulfonyl group is oriented such that the bond $\mathrm{S}-\mathrm{O} 4$ is approximately coplanar with the aromatic ring (torsion angle O 4 -S—C5-C6-6.70 (9) ${ }^{\circ}$ ).
The molecules are linked by classical hydrogen bonds from the NH group to the carbonyl oxygen (and not, as might have been expected, to a sulfonyl oxygen); the packing diagram (Fig. 2) shows chains of molecules parallel to the a axis. The four "weak" hydrogen bonds crosslink these chains to a three-dimensional pattern.

## S2. Experimental

Alanine ( 0.02 mol ) was dissolved in an aqueous solution of potassium carbonate ( $0.06 \mathrm{~mol}, 50 \mathrm{ml}$ ) and a solution of 4methylbenzenesulfonyl chloride ( 0.027 mol ) in toluene ( 30 ml ) was added. On completion of the reaction, the organic layer was separated and the aqueous layer acidified using dilute hydrochloric acid. The 2-(4-methylphenylsulfonylamino)propanoic acid thus obtained was filtered off and recrystallized from aqueous ethanol.
2-(4-Methylphenylsulfonylamino)propanoic acid ( 0.02 mol ) was dissolved in methanol ( 30 ml ), sulfuric acid ( 0.5 ml ) was added and the mixture subjected to reflux while the reaction was monitored by TLC at regular intervals. After completion of the reaction, the reaction mixture was concentrated on the rotary evaporator to remove excess methanol. The product thus obtained was poured into water, neutralized with sodium bicarbonate and extracted with ethyl acetate (3 $\times 50 \mathrm{ml}$ ). The combined organic extracts were dried over anhydrous sodium sulfate and the solvent evaporated on a rotary evaporator. The product was recrystallized from acetone/water.

## S3. Refinement

The NH hydrogen was refined freely. Methyl H atoms were located in difference syntheses, idealized to C—H $0.98 \AA$ and $\mathrm{H}-\mathrm{C}-\mathrm{H} 109.5^{\circ}$, and refined as rigid groups allowed to rotate but not tip. Other H atoms were placed in calculated positions and refined using a riding model with $\mathrm{C}-\mathrm{H} 0.95 \AA$ for aromatic H and $1.00 \AA$ for methine CH . Hydrogen U values were fixed at $1.5 \times \mathrm{U}(\mathrm{eq})$ of the parent atom for methyl H and $1.2 \times \mathrm{U}(\mathrm{eq})$ of the parent atom for other H . The compound is enantiomerically pure and its absolute configuration (S at C2) was confirmed by the Flack (1983) parameter.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
