Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \mathrm{~A}$; $R$ factor $=0.020 ; w R$ factor $=0.054 ;$ data-to-parameter ratio $=15.0$.

In the title complex, $\left[\mathrm{Ag}\left(\mathrm{NO}_{3}\right)\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NO}\right)\right]_{n}$, the $\mathrm{Ag}^{\mathrm{I}}$ atom is coordinated by two O atoms from two different 4 -pyridone ligands and two O atoms from one nitrate anion, displaying a nearly planar coordination geometry. The O atoms of two 4pyridone ligands bridge two symmetrically related $\mathrm{AgNO}_{3}$ units, forming a dimer, with an $\mathrm{Ag} \cdots \mathrm{Ag}$ separation of 3.680 (2) Å. Neighbouring dimers are linked into an infinite chain through weak Ag...O interactions [2.765 (2) Å], $\mathrm{Ag} \cdots \mathrm{Ag}$ interactions $[3.1511$ (4) $\AA$ ] and $\pi-\pi$ stacking interactions [centroid-centroid distance $=3.623$ (4) Å]. $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds assemble these chains into a three-dimensional network.

## S1. Comment

Hydroxypyridines $(\mathrm{PyOH})$, such as 2-, 3- and 4-PyOH, have attracted great attention in the field of crystal engineering as good candidates for the construction of supramolecular systems because they are bifunctional ligands that are not only capable of coordinating to metal ions but can also form classical hydrogen bonds as both donors and acceptors (Holis \& Lippard, 1983; Klausmeyer \& Beckles, 2007). 4-PyOH has two tautomers, dominated by the presence of keto form in polar solvents (Deng et al., 2005; John \& Urland, 2006). Thus, the protonated N atom can act as hydrogen bond donor and the PyOH uses O atom to coordinate to metal. However, the coordination chemistry of 4-PyOH ligand is still underveloped and only a few complexes have been structurally characterized in recent years (Gao et al., 2004; Leng \& Ng , 2007; Li, Yan et al., 2005). In order to gain further insight into the metal-binding modes of the 4-PyOH ligand, we introduced $\mathrm{Ag}^{\mathrm{I}}$ ion into the coordination system of the $4-\mathrm{PyOH}$ ligand. In the present paper, the $\mathrm{Ag}^{\mathrm{I}}$ ion only coordinates via the unfavoured O atom of 4-pyridone ligand, producing the title one-dimensional coordination polymer, which exhibits a three-dimensional hydrogen-bonded architecture.
The coordination environment of $\mathrm{Ag}^{\mathrm{I}}$ centre is shown in Fig. 1. Each $\mathrm{Ag}^{\mathrm{I}}$ atom is coordinated by two O atoms from two different 4-pyridone ligands and two O atoms from one nitrate anion (Table 1), displaying a nearly planar coordination geometry. Two 1 H -pyridin-4-one ligands use their O atoms to bridge two symmetrically related $\mathrm{AgNO}_{3}$ units to form a dimer, with an $\mathrm{Ag} \cdots \mathrm{Ag}$ separation of 3.680 (2) $\AA$. The adjacent dimers are linked through weak $\mathrm{Ag} \cdots \mathrm{Ag}$ interactions [3.1511 (4) $\AA$ ] into a one-dimensional polymeric chain, which is also stabilized by weak $\mathrm{Ag} \cdots \mathrm{O}$ interactions [2.765 (2) $\AA$ ] and intrachain $\pi-\pi$ interactions (Fig. 2). The centroid-centroid and interplanar distances between adjacent pyridyl rings are 3.623 (4) and 3.301 (4) $\AA$, respectively, thus indicating a weak $\pi-\pi$ contact (Deisenhofer \& Michel, 1998; Li, Yin et al., 2005; Pan \& Xu, 2004; Wu et al., 2003). The polymeric chain shows a staircase-like array, with an $\mathrm{Ag} \cdots \mathrm{Ag} \cdots \mathrm{Ag}$ angle of $63.51(4)^{\circ}$ between three successive Ag atoms along the chain. Such an array in the chain may be explained to avoid steric hindrance. $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds between the ligand N atoms and the nitrate O atoms (Table 2) link adjacent chains to furnish a lamellar layer. The interlayer $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 2) further assemble the neighbouring layers, giving rise to a three-dimensional supramolecular network (Fig. 3).

## S2. Experimental

A mixture of silver nitrate ( $0.17 \mathrm{~g}, 1 \mathrm{mmol}$ ), 4-hydroxypyridine ( $0.095 \mathrm{~g}, 1 \mathrm{mmol}$ ), $\mathrm{NaOH}(0.02 \mathrm{~g}, 0.5 \mathrm{mmol})$ and $\mathrm{H}_{2} \mathrm{O}$ $(12 \mathrm{ml})$ was placed in a 23 ml Teflon-lined reactor, which was heated to 433 K for 3 d and then cooled to room temperature at a rate of $10 \mathrm{~K} \mathrm{~h}^{-1}$. The crystals obtained were washed with water and dried in air (yield $0.18 \mathrm{~g}, 69.2 \%$ ).

## S3. Refinement

C-bound H atoms were positioned geometrically and treated as riding atoms, with $\mathrm{C}-\mathrm{H}=0.93 \AA$, and with $U_{\text {iso }}(\mathrm{H})=$ $1.2 U_{\text {eq }}(\mathrm{C})$. H atom on N atom was located on difference Fourier map and refined with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{N})$.

Figure 1
The asymmetric unit of the title compound. H atoms have been omitted for clarity. Displacement ellipsoids are drawn at the $50 \%$ probability level. [Symmetry code: (i) -x, 1-y, 1-z.]

Figure 2
View of one-dimensional infinite chain. Dashed lines denote $\mathrm{Ag} \cdots \mathrm{Ag}$ and $\pi-\pi$ interactions.

Figure 3
A packing view of the title compound. Hydrogen bonds are shown as dashed lines.
