

Tetra- μ -acetato- κ^8 O:O'-bis[(N^2,N^2 -di-methylpyrazin-2-amine- κN^4)copper(II)]

Lin Meng, Lin Yan Yang and Jing Min Shi*

Department of Chemistry, Shandong Normal University, Jinan 250014, People's Republic of China
Correspondence e-mail: shijingmin1955@yahoo.com.cn

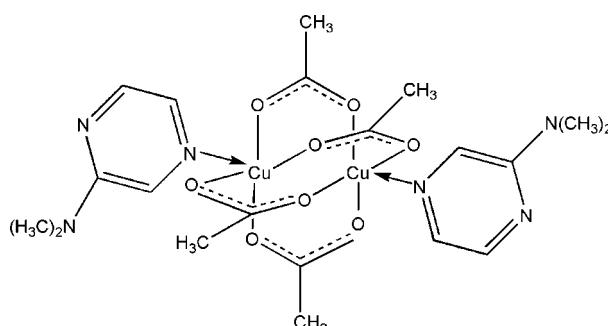

Received 19 April 2009; accepted 7 May 2009

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.004$ Å;
 R factor = 0.032; wR factor = 0.094; data-to-parameter ratio = 14.8.

The title binuclear complex, $[Cu_2(C_2H_3O_2)_4(C_6H_9N_3)_2]$, lies on an inversion center with four acetate ligands bridging two Cu^{II} ions and two monodentate N,N -dimethylpyrazine-2-amine ligands coordinating each Cu^{II} ion via N atoms, forming slightly distorted square-pyramidal environments.

Tetra- μ -acetato- κ^8 O:O'-bis[(N²,N²-dimethylpyrazin-2-amine- κ N⁴)copper(II)]

Lin Meng, Lin Yan Yang and Jing Min Shi

S1. Comment

Both acetate anions and pyrazine derivatives are useful ligands and a large number of multi-atom complexes have been synthesized with these as bridging ligands (Zhang *et al.*, 2007; Li *et al.*, 2003). We attempted to synthesize a mixed bridged multi-nuclear Cu^{II} complex by using acetate and N,N-dimethylpyrazine-2-amine as bridging ligands. The title complex was obtained and here we report its crystal structure, (I), Fig. 1.

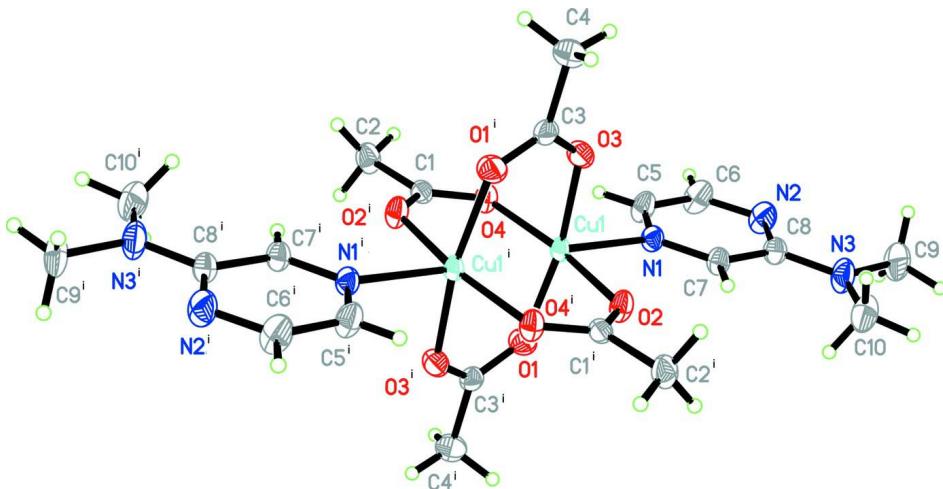

The unique Cu^{II} ion is in a slightly distorted square-pyramidal coordination geometry with atom N1 lying at the apex. Four acetate ligands coordinate to two symmetry-related Cu^{II} atoms, with a Cu1···Cu1ⁱ separation of 2.6326 (6) Å and inversion centre lies at the middle of the Cu1···Cu1ⁱ vector (symmetry code, (i): -x + 1, -y + 1, -z + 2) resulting in the formation of a binuclear complex. The title complex is similar to a reported binuclear Cu^{II} complex (Zhang *et al.*, 2007) except the title complex exhibits a slightly shorter Cu—N bond and a slightly longer Cu—Cu distance.

S2. Experimental

N,N-dimethylpyrazine-2-amine (0.0954 g, 0.0696 mmol) was dissolved in 10 ml methanol and it was added into 10 ml water solution containing copper acetate (0.1390 g, 0.696 mmol), and the mixed solution was stirred for a few minutes. The blue single crystals were obtained after the solution had been allowed to stand at room temperature for five months.

S3. Refinement

All H atoms were placed in calculated positions and refined as riding with C—H = 0.96 Å, $U_{\text{iso}} = 1.5U_{\text{eq}}(\text{C})$ for methyl group and C—H = 0.93 Å, $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$ for pyrazinyl H atoms.

**Figure 1**

The molecular structure of title compound with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. Primed atoms are related by the symmetry operator (-x + 1, -y + 1, -z + 2).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
