Received 20 May 2009; accepted 27 May 2009

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(C-C) = 0.005$  Å; disorder in solvent or counterion;  $R$  factor = 0.048;  $wR$  factor = 0.151; data-to-parameter ratio = 15.4.

The title compound,  $[Ni(C_8H_5O_4)(C_{16}H_{36}N_4)]ClO_4 \cdot H_2O$ , has the Ni<sup>II</sup> atom in a distorted octahedral geometry, surrounded by coordination by four N atoms of the 5,5,7,12,12,14-hexamethyl-1,4,8,11-tetraazacyclotetradecane ligand in a folded configuration, and two carboxylate O atoms of the 2-carboxybenzoate ligand in *cis* positions. The complex cation, the disordered perchlorate anion [occupancies 0.639 (8): 0.361 (8)] and uncoordinated water molecules engage in N—H···O and O—H···O hydrogen bonding, forming a layer structure parallel to (010).

### S1. Comment

Recently, many helical structures were constructed through the coordination interactions, and helical polymers constructed *via* hydrogen bonding are still rare, and only a few cases have been reported (Khatua *et al.*, 2006; Lonnon *et al.*, 2006; Telfer & Kuroda, 2005). Then we employ racemic nickel(II) complex and phthalic acid as building blocks to construct helical structure, but the result of experiment indicate a racemic complex of  $[Ni(rac-L)(Hpt)(ClO_4)]H_2O$  ( $H_2pt$ =phthalic acid) is obtained.

In the asymmetric unit of (I), contains one  $[Ni(rac-L)(Hpt)]^+$  cation, one  $[ClO_4]^-$  anion and one water molecule. The  $[ClO_4]^-$  anion is disordered over two symmetry related sites with 50% occupancy. As illustrated in Fig.1, The six-coordinated  $Ni^{2+}$  of  $[Ni(rac-L)(Hpt)]^+$  cation displays a distorted octahedral geometry by coordination with four N atoms of macrocyclic ligand  $L$  in a folded configuration, and two carboxylate oxygen atoms of phthalic acid in *cis*-position. Neighbouring cations, anions and water molecule are discrete, connected to each other through intermolecular hydrogen bond.

### S2. Experimental

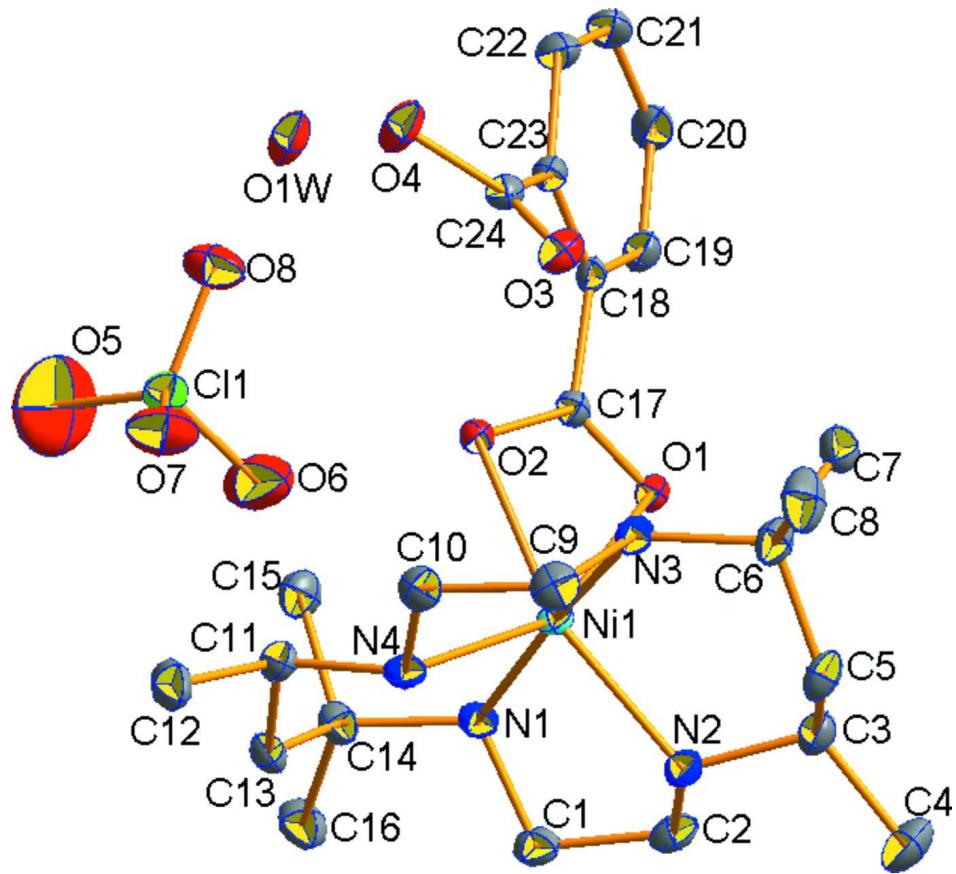

Phthalic acid ( $H_2pt$ , 0.166 g, 1 mmol) was mixed with NaOH (0.040 g, 1 mmol) dissolved in 10 ml of water. To this solution was added  $[Ni(rac-L)](ClO_4)_2$  (0.541 g, 1 mmol) dissolved in a minimum amount of CH<sub>3</sub>CN. The solution was left to stand at room temperature and blue crystals formed after several weeks.

### S3. Refinement

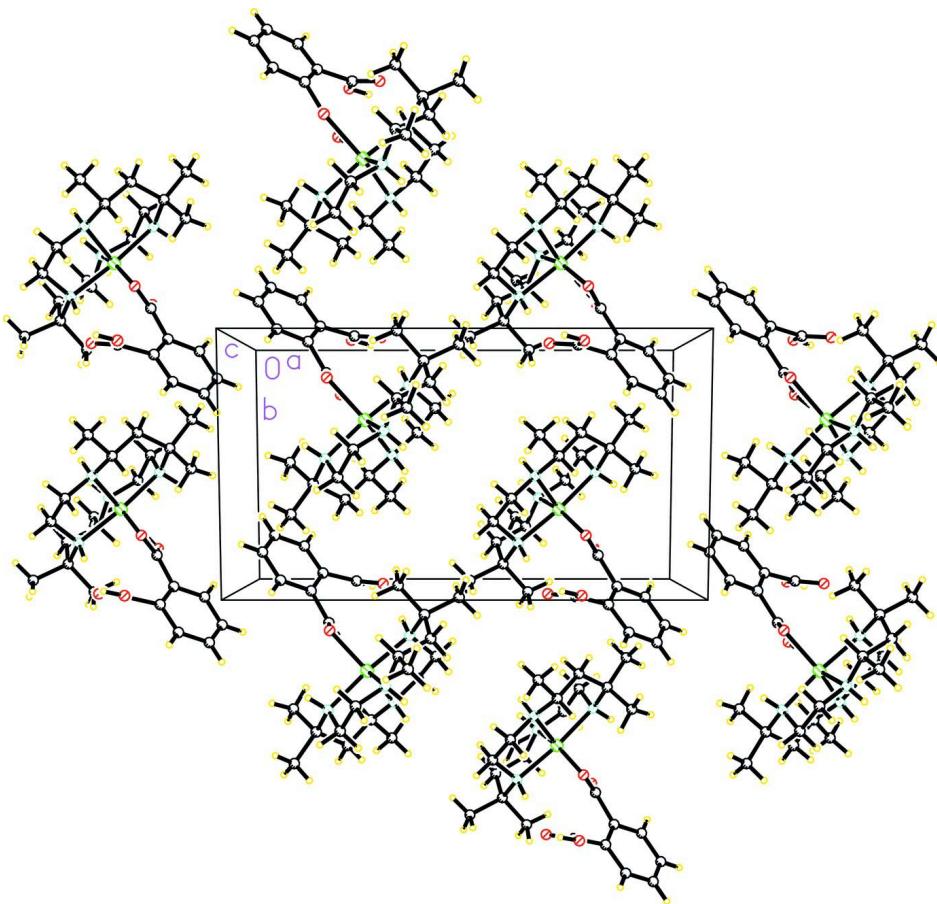

H atoms bound to C, O and N atoms were positioned geometrically and refined using the riding model, and with C—H = 0.95 to 1.00 Å, O—H = 0.84 Å and N—H = 0.93 Å, and with  $U(H)$  set to 1.2 to 1.5  $U_{eq}(C, O, N)$ .

H atoms attached to O (water) atoms were located in difference Fourier maps and constrained to ride on their carrier atoms, with O—H distances in the range 0.86 Å, and with  $U_{iso}(H) = 1.2$  times  $U_{eq}(O)$ .

Disorder in the  $[ClO_4]^-$  anion required the Cl—O distance to be restrained to  $1.44 \pm 0.01$  Å and the O—O distance to  $2.35 \pm 0.02$  Å.

**Figure 1**

The molecular structure of (I), showing displacement ellipsoids at the 30% probability level. H-atoms have been excluded for clarity.

#### Refinement

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.048$   
 $wR(F^2) = 0.151$   
 $S = 1.07$   
6322 reflections  
411 parameters  
47 restraints  
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map  
Hydrogen site location: inferred from neighbouring sites  
H atoms treated by a mixture of independent and constrained refinement  
 $w = 1/[c^2(F_o^2) + (0.0858P)^2 + 1.13P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\text{max}} < 0.001$   
 $\Delta\rho_{\text{max}} = 0.77 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.42 \text{ e } \text{\AA}^{-3}$

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
