Received 22 June 2009; accepted 3 July 2009

Key indicators: single-crystal X-ray study; $T = 294$ K; mean $\sigma(\text{C}-\text{C}) = 0.007$ Å; R factor = 0.029; wR factor = 0.057; data-to-parameter ratio = 16.8.

The title compound, $[\text{Pb}_2(\text{CH}_3\text{COO})_2(\text{C}_7\text{H}_5\text{O}_2)_2(\text{C}_{12}\text{H}_8\text{N}_2)_2] \cdot 2\text{H}_2\text{O}$, consists of dimeric units built up around a crystallographic centre of symmetry and two non-coordinating water molecules. Each Pb^{II} unit is six-coordinated by a bidentate 1,10-phenanthroline (phen) ligand, a monodentate acetate anion and a bidentate benzoate anion, which also acts as a bridge linking the two Pb^{II} atoms. The crystal packing is stabilized by $\text{O}-\text{H} \cdots \text{O}$ hydrogen bonds and by $\pi-\pi$ interactions between the phen rings of neighboring molecules, with a centroid–centroid distance of 3.577 (3) Å.

Di- μ -benzoato- $\kappa^3O,O':O;\kappa^3O:O,O'$ -bis[(acetato- κO)(1,10-phenanthroline- κ^2N,N')lead(II)] dihydrate

Junli Gao and Xiaopeng Xuan

S1. Comment

Because of the increasing impact of the toxic heavy metal lead on the natural environment, the coordination behavior of lead ion has received more and more attention. Lead(II) is capable of exhibiting a variable coordination number and geometry with or without a stereochemically active lone pair of electrons (Shimonov-Livny *et al.* 1998). Among such compounds, a number of centrosymmetric dinuclear lead(II) compounds with 1,10-phenanthroline (phen) or its derivatives and oxygen donor ligands have been structurally characterized (Li & Yang, 2004, Xuan *et al.* 2008, Xuan & Zhao, 2007, Zhao *et al.* 2007, Zhu *et al.* 2004.). Recently, we obtained the title lead(II) complex containing two different kinds of anions, by the reaction of lead acetate, sodium benzoate and phen in ethanol/water mixtures.

The crystal structure of the title compound consists of dimeric units $[\text{Pb}_2(\text{C}_2\text{H}_3\text{O}_2)_2(\text{C}_7\text{H}_5\text{O}_2)_2(\text{C}_{12}\text{H}_8\text{N}_2)_2]$, related by a crystallographic inversion centre (Fig. 1), and two uncoordinated water molecules. Both the acetate and benzoate anions are coordinated to each Pb(II) atom and a carboxylate oxygen of each benzoate anion forms a bridge between the two inversion related lead atoms. Each lead atom is chelated by the two N atoms of phen with Pb—N distances of 2.619 (4), and 2.688 (4) Å, three carbonyl oxygen atoms of two benzoate anions and one carbonyl oxygen atoms of an acetate anion. The weak Pb—O bridging interactions form a four-membered Pb_2O_2 quadrilateral with a Pb—Pb separation of 4.289 (5) Å.

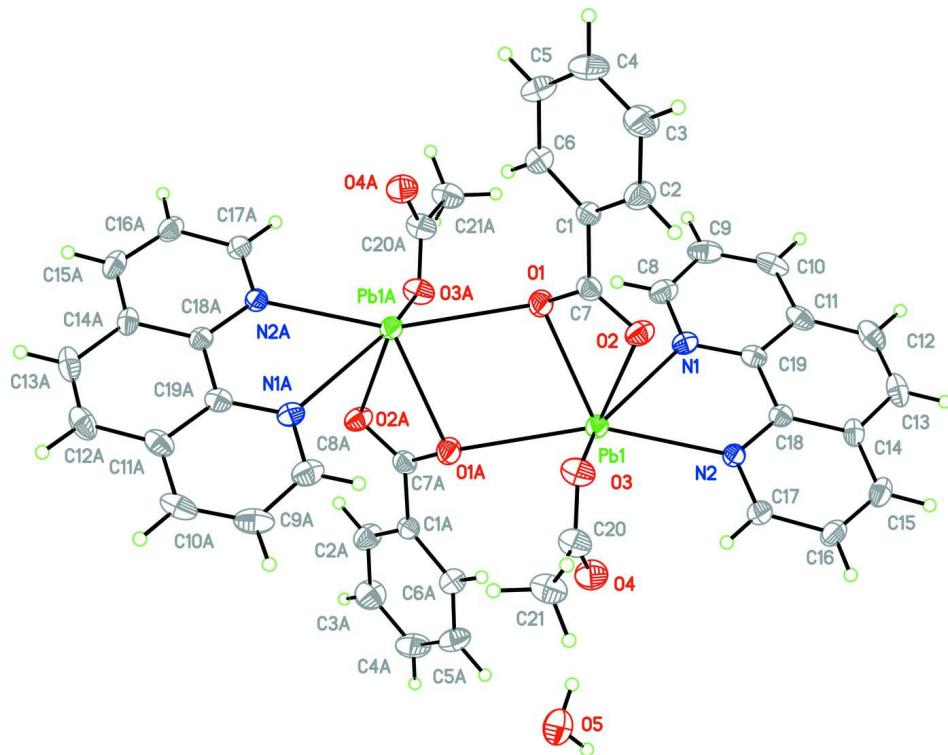

The crystal structure is stabilized by intermolecular O—H···O hydrogen bonds (Table 1 and Figure 2). The uncoordinated water molecules participate in hydrogen bonding to oxygen atoms of the acetate anions. The crystal packing is further stabilized by π – π stacking interactions between adjacent phen molecules. The centroid-centroid distance between $Cg1$ (N1/C8—C11/C19) and $Cg2$ (N2/C14—C18)[symmetry code: 1 - x , - y , 1 - z] is 3.575 (3) Å.

S2. Experimental

A solution (10 ml) of ethanol containing 1,10-phenanthroline (0.5 mmol) and sodium benzoate (1 mmol) was added slowly to a aqueous solution (10 ml) containing lead acetate trihydrate (0.5 mmol). The mixture was refluxed for 5 h and the resulting white precipitate was filtered. Block-like single crystals were obtained by slow evaporation of the filtrate at room temperature after five days.

S3. Refinement

The carbon-bound H atoms were placed in calculated positions and were included in the refinement in the riding model approximation, with C—H = 0.93 Å and $U_{iso}(\text{H}) = 1.2U_{eq}(\text{C aromatic})$. The water H atoms were restrained at O—H = 0.83 Å with $U_{iso}(\text{H}) = 1.5U_{eq}(\text{O})$.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
